

CHAPTER III.

URBAN MANUFACTURES.

By WILLIAM M. STEUART.

I.

PROPORTION OF MANUFACTURES IN CITIES.

1. *Number of Cities Treated at the Different Censuses.*—The importance of the manufactures in urban districts was first recognized in the census reports of 1880, when the statistics for 100 cities were published separately. This practice has been followed at each subsequent census by a more extended presentation of the statistics for urban industries.

There were 165 cities similarly treated in 1890 and 1,340 cities and towns in 1900. The statistics for the 100 cities in 1880, the 165 in 1890, and 209 of the 1,340 cities and towns in 1900 were published in detail by specified industries. In 1900 the totals for all industries in each of the remaining 1,131 cities and towns are shown in the Report on Manufactures, Part II.

The importance of the statistics of manufactures in cities and towns is further emphasized by the increasing care taken at recent censuses in the canvass of such places, the work being assigned to special agents and withdrawn from the enumerators of the population. The development of this method since 1880 and the basis upon which the localities to be canvassed in this

manner in 1900 were selected is fully discussed in the section on "Field Work," pages xxi to xxv of Chapter I of this introduction.¹

The concentration of manufacturing industries in urban districts has been one of the leading features of the industrial development of the United States. The proportion of manufactures in the principal cities has increased during each decade to and including 1890, but during the last ten years there has apparently been a decided tendency toward a wider distribution. The extent of this concentration during the last three decades may be determined with some definiteness by comparing the increase in the 100 principal cities, for which statistics were separately shown in 1880, with the increase in the districts outside of these cities and also by noting the proportion which the manufactures of these 100 cities have formed of the totals for the entire country at each of the last three censuses. The percentages of increase and the proportion shown in the following tables should be considered in connection with the remarks concerning comparisons with previous censuses, page lxi, of this introduction.

2. *100 Principal Cities.*—The increase in population and manufactures of the 100 principal cities, as compared with the increase in the United States and in the country outside the cities, is indicated by table i.

¹ The following statement shows the number of cities (or cities and towns) for which statistics were presented separately, the number for which detailed statistics were published, and the number of cities and towns canvassed by special agents in 1880, 1890, and 1900.

	1900	1890	1880
Cities and towns canvassed by special agents.....	1,340	1,042	279
Cities for which general statistics are shown.....	1,340	165	100
Cities with a population exceeding 20,000, for which statistics are shown in detail by industries.....	290	165	100

The above figures for 1900 do not include Honolulu, H. I., the statistics of which were collected by special agents and are published in detail by industries. For the purposes of comparison the 165 cities for 1890 are reduced to 164 by the omission of Lincoln, R. I. See page ccxx.

(ccxviii)

URBAN MANUFACTURES.

CCKIX

TABLE I.—100 PRINCIPAL CITIES, COMPARED WITH THE UNITED STATES AND THE UNITED STATES, EXCLUSIVE OF THESE CITIES: 1880, 1890, AND 1900.

ITEMS.	1900	1890	1880	INCREASE.		PER CENT OF INCREASE.

¹Exclusive of 395 establishments in Hawaii, 63 in Alaska, and 85 governmental in District of Columbia.

²Exclusive of 10 establishments in Alaska.

³Exclusive of 63,592 persons in Alaska, 154,001 in Hawaii, 392,060 in Indian Territory, and 125,048 on Indian reservations, which classes were not included at previous censuses.

⁴Exclusive of 119 establishments in Honolulu, H. I., and 85 governmental in District of Columbia.

The percentage of increase in the population of the 100 cities in each of the census periods, as shown in this table, has been somewhat in excess of the percentage of increase for the United States, or for the districts outside of the cities. The percentages of increase for the manufactures in the cities during the decade ending with 1890, were also in excess of the percentages for the United States or for the districts outside of the cities, but during the decade ending with 1900 the manufactures of the cities do not appear to have increased with the same degree of rapidity as in the country at large, or in the districts outside of the cities. Indeed, the percentage of increase for each item except population in the cities was somewhat less than the increase for the corresponding item in the United States or in the country outside of the cities.

The percentages of increase during the ten years ending with 1890 in the number of establishments in the United States, in the 100 cities, and in the country outside of these cities were 40, 115.1, and 6.7, respectively. During the decade ending with 1900 the number of establishments in the United States increased 44.1 per cent, in the cities 10.9 per cent, and in the districts outside of the cities 73.8 per cent. The percentages of increase shown for the remaining items given in the table indicate a greater uniformity in the increase for cities and the districts outside of cities.

The percentages of increase shown in the above table should be considered in connection with the proportion which the manufactures and population of the 100 cities

have formed of the total for the United States at the last three censuses, as given in table II.

TABLE II.—100 principal cities: per cent of the United States, 1880, 1890, and 1900.

ITEMS.	DATE OF CENSUS.		
	1900	1890	1880
Number of establishments.....	36.3	47.2	30.7
Capital.....	51.0	64.0	49.6
Wage-earners, average number.....	49.7	54.3	52.4
Total wages.....	53.1	60.3	55.6
Cost of materials used.....	60.4	53.0	56.3
Value of products.....	52.6	60.0	56.2
Population.....	22.8	21.0	18.2

The large percentage of increase shown in table I for the manufactures of the 100 cities during the decade ending with 1890 was accompanied by an increase in the proportion of the manufactures in these cities, while the smaller percentage of increase for the ten years ending with 1900 was accompanied by a decrease in this proportion. For instance, in 1880 the establishments in the 100 cities formed 30.7 per cent of the total for the United States, this percentage increasing to 47.2 per cent in 1890 and decreasing to 36.3 per cent in 1900. A similar increase followed by a decrease is shown for each of the items given for manufactures, the proportion of products increasing from 56.2 per cent in 1880 to 60 per cent in 1890, and decreasing to 52.6 per cent in 1900. The proportion of the population in the cities, however, has increased steadily, from 18.2 per cent in 1880 to 22.8 per cent in 1900.

3. *164 Principal Cities.*¹—The tendency toward a more rapid increase in the manufactures of the country outside the principal cities, and toward a resulting decrease in the proportion of manufactures in these cities is also indicated by tables III and IV. Table III shows the manufacturing and population statistics in 1890 and 1900 for the United States as a whole, for the 164 cities with a population of 20,000 or over, which were separately reported at the census of 1890, and for the districts outside of these 164 cities. It also shows in separate columns the absolute and relative increase in all items during the census period.

TABLE III.—*164 principal cities, compared with the United States and the United States exclusive of these cities: 1890 and 1900.*

ITEMS.	1900	1890	INCREASE 1890 TO 1900.

Value of products.....	\$5,204,636,399	\$3,089,940,507	\$2,104,695,892	67.9
Population.....	55,891,001	47,742,638	8,148,363	14.6

¹Exclusive of 395 establishments in Hawaii, 63 in Alaska, and 85 Governmental in District of Columbia.

²Exclusive of 10 establishments in Alaska.

³Exclusive of 63,592 persons in Alaska, 154,001 in Hawaii, 392,060 in Indian Territory, and 125,048 on Indian reservations, which classes were not included at previous censuses.

⁴Exclusive of 119 establishments in Honolulu, H. I., and 85 governmental in District of Columbia.

With the exception of the percentage of population, the increase for every item in the total for the United States and for the country exclusive of the cities has

¹The 165 cities reported separately in 1890 had decreased to 162 cities in 1900, by the consolidation of Brooklyn, Long Island City, and New York on January 1, 1898, and the subdivision of the town of Lincoln, R. I., by the formation of the city of Central Falls, neither of the subdivisions having a population of 20,000 in 1900.

been in excess of the increase for the corresponding item in the totals for the 164 cities. This confirms the statistics of tables I and II, in showing a more rapid increase in the smaller cities and rural districts than in the large urban centers.

The proportion that the manufactures and population of the same cities have formed of the totals for the United States at the censuses of 1890 and 1900 are shown in table IV.

TABLE IV.—*164 principal cities: Per cent of the United States, 1890 and 1900.*

ITEMS.	DATE OF CENSUS.	
	1900	1890
Number of establishments.....	41.2	52.3
Capital.....	57.4	61.1
Wage-earners, average number.....	56.8	61.8
Total wages.....	60.5	67.7
Cost of materials used.....	58.1	65.1
Value of products.....	60.0	66.9
Population.....	26.0	23.8

While the percentage of population in the 164 cities increased from 23.8 per cent in 1890 to 26 per cent in 1900, the percentage of the various items of manufactures uniformly decreased, the number of establishments decreasing from 52.3 to 41.2 per cent; the capital from 61.1 to 57.4 per cent; the number of wage-earners from 61.8 to 56.8 per cent; the amount of wages from 67.7 to 60.5 per cent; the cost of materials from 65.1 to 58.1 per cent; and the value of products from 66.9 to 60 per cent. The percentages given in table IV are in harmony with those in table II, in that they indicate a decrease during the last decade in the proportion of manufactures in the large cities.

The percentage of increase in the manufactures of the principal cities, and also the proportion which the industries in these cities form of the totals for the United States, is considered further in connection with the statistics for the manufactures of the 100 counties in which the principal cities are located (see page cclvi).

4. *1,340 Principal Cities and Towns.*—In 1900, 1,340 principal cities and towns were withdrawn from the enumerators and canvassed by special agents, and the reports from these places constitute the statistics for urban manufactures for the Twelfth Census.

The territory included in a number of these places, especially in the New England states, is in some respects rural rather than urban, and therefore the statistics can not be accepted as pertaining entirely to establishments located in urban districts.

During the decade from 1890 to 1900 the following 47 cities have increased their population above the

20,000 limit, and their statistics are shown in detail by industries for the first time in the Twelfth Census:

San Jose, Cal.	East Orange, N. J.
New Britain, Conn.	New Brunswick, N. J.
Jacksonville, Fla.	Orange, N. J.
Aurora, Ill.	Passaic, N. J.
Decatur, Ill.	West Hoboken, N. J.
East St. Louis, Ill.	Amsterdam, N. Y.
Elgin, Ill.	Jamestown, N. Y.
Anderson, Ind.	Schenectady, N. Y.
Muncie, Ind.	Watertown, N. Y.
Cedar Rapids, Iowa.	Hamilton, Ohio.
Clinton, Iowa.	Lima, Ohio.
Leavenworth, Kans.	Easton, Pa.
Bangor, Me.	Newcastle, Pa.
Everett, Mass.	Norristown, Pa.
North Adams, Mass.	Shenandoah, Pa.
Pittsfield, Mass.	Warwick, R. I.
Quincy, Mass.	Columbia, S. C.
Waltham, Mass.	Austin, Tex.
Kalamazoo, Mich.	Waco, Tex.
Joplin, Mo.	Roanoke, Va.
Butte, Mont.	Spokane, Wash.
South Omaha, Nebr.	Sheboygan, Wis.
Nashua, N. H.	Superior, Wis.
Bayonne, N. J.	

There were 4 cities, Colorado Springs, Colo., Atlantic City, N. J., Mt. Vernon, N. Y., and Newport, R. I., having a population of 20,000 or over at the census of 1900, which were used largely for residential purposes or as summer resorts. The manufacturing industries in these cities were comparatively insignificant, and are not shown by industries.

In 1890 the town of Lincoln, R. I., had a population of more than 20,000, and its statistics were presented by industries. In 1895 the city of Central Falls was

formed from the town of Lincoln. Neither of the subdivisions of the territory contained a population of 20,000 in 1900.

For purposes of comparison, table v is presented, showing the general manufacturing and population statistics of the 209 cities with a population of 20,000 or over in 1900 (Honolulu, H. I., being omitted).

TABLE V.—Totals for 209 principal cities, and for the country exclusive of these cities: 1900.

ITEMS.	United States.	209 CITIES.		EXCLUSIVE OF 209 CITIES.	
		Total.	Per cent of United States.	Total.	Per cent of United States.

¹ Exclusive of 395 establishments in Hawaii, 63 in Alaska, 85 governmental in District of Columbia.

² Exclusive of 119 establishments in Honolulu, H. I., and 85 governmental in District of Columbia.

³ Exclusive of 63,592 persons in Alaska, 154,001 in Hawaii, 392,060 on Indian reservations, and 91,219 in the military and naval service (including civilian employees, etc.) stationed abroad.

As was shown in table iv, the manufacturing establishments in the 164 principal cities represented more than half of the manufacturing of the entire country, but they can not be accepted as representing the total of the urban manufactures. The addition of 1,176 cities to these 164, making the total 1,340, as in table vi, permits the presentation of statistics really representative of the urban interests, for this total includes practically all places that can be considered in any sense urban, and that have manufactures of any comparative importance. The addition of the 1,176 cities does not of course result in an increase in any of the items of the table at all proportionate to the increase in the number of cities shown, but it increases the per cent of the population in the urban districts to the total population by 11.7, of the number of the establishments by 18.8, of the number of wage-earners by 23.3, of wages by 22.6, and of the value of products by 21.1 per cent. The fact that the increase is so small shows that only a comparatively small proportion of manufactures was in the smaller cities and towns.

Accepting the 1,340 cities and towns as representing the urban manufactures, it appears that not only are a large proportion of the establishments located in the urban districts, but these districts contain a much larger proportion of the capital, wage-earners, wages, and products of the manufactures. For each dollar of capital invested in manufactures in the rural districts, \$3.80 were invested in the urban districts; for each wage-earner employed in the rural districts, 4.02 were employed in the urban districts; for each dollar paid in wages in rural manufactures, \$4.93 were paid in the cities; and for each dollar of product manufactured in rural districts, \$4.28 were produced in the cities.

The same conditions are represented graphically in the following diagrams, the first of which shows the importance of urban and rural manufactures relatively to each other, and relatively to the totals for the United States at the census of 1900, as shown by the statistics of capital, wages, and value of products; while the second similarly shows the relative numbers of wage-earners in the cities, the rural districts, and the country as a whole.

The capital shown in the table represents the amount of capital owned by the establishments reporting. In a large number of cases, land, buildings, and machinery were rented by the manufacturers, and in such instances their value was not included. It appears that while the capital in the urban districts represented 79.2 per cent of the total for the country, the value of land in urban manufactures formed only 69.2 per cent of the total value of land for the manufactures of the United States, and the buildings 76.6 per cent of the total value of buildings.

5. *Size of Average Establishment.*—The establishments in the cities were as a rule much larger than those in the rural districts. This is illustrated by table vii, which shows the average capital, etc., for each establishment in the United States and in the urban and rural districts, respectively.

The fact that the proportion shown for capital, wage-earners, wages, materials, and value of products, for the industries of the cities, was greater than the proportion for the number of establishments, indicates that the establishments in the urban districts were larger than those in the rural districts.

TABLE VII.—Average size of establishments in the United States and urban and rural districts: 1900.

ITEMS.	United States.	1,340 cities.	United States, exclusive of 1,340 cities.
Capital.....	\$19,160	\$25,278	\$9,984
Salaries of officials, clerks, etc.....	1	1	(1)
Salaries.....	\$788	\$1,151	\$244
Average number of wage-earners.....	10	14	6
Total wages.....	\$4,531	\$6,279	\$1,911
Miscellaneous expenses.....	\$2,006	\$2,994	\$525
Cost of materials used.....	\$14,338	\$19,049	\$7,271
Value of products.....	\$25,381	\$34,288	\$12,022

¹ Less than 1.

The averages shown in this table are obtained by dividing the total amounts reported for the United States and for the urban and rural districts, respectively, by the number of establishments reported in each case. The size of the average establishment in the cities was, as estimated from the value of products, almost three times as large as the average establishment in the rural districts. But these calculations include the number and amounts reported for all small shops engaged in the neighborhood industries and hand trades. In order to show the size of the average manufacturing establishment it is necessary to eliminate the small shops. This is done in table viii, which shows the size of the average establishment as computed for the 73 principal industries of the 209 cities with a population of 20,000 or over, and for the same industries in the districts outside of these cities.

URBAN MANUFACTURES.

ccxxiii

TABLE VIII.—Average size of establishments for 73 selected industries, 209 cities, the United States, and the United States exclusive of these cities.

ITEMS.	United States.	209 cities.	United States exclusive of 209 cities.
Capital.....	\$88,319	\$59,198	\$23,599
Salaried officials, clerks, etc.....	2	3	1
Salaries.....	\$1,784	\$3,120	\$757
Average number of wage-earners.....	21	33	13
Total wages.....	\$9,316	\$15,060	\$5,267
Miscellaneous expenses.....	\$4,629	\$8,658	\$1,808
Cost of materials used.....	\$29,119	\$45,996	\$17,220
Value of products.....	\$51,273	\$82,884	\$28,986

The 73 industries were selected because they were the principal industries of the cities reporting. The averages shown in the table are greatly in excess of those in table VII, where all classes of establishments are considered. The size of the average establishment

in the 73 selected industries for the 209 cities is twice as large as that of the average establishment in all industries as shown in table VII. It also appears that the size of the average establishment engaged in these industries in the cities is almost three times the size of the average establishment engaged in the same industries in the country outside of these cities, taking, as before, the value of products as the basis of the comparison.

6. *Geographic Divisions.*—To aid in determining the region of greatest concentration in urban districts table IX is presented, showing the totals for each geographic division, for all cities in each division, and for the districts in the division which are outside the cities, together with the per cent which each item in the subdivisions bears to the corresponding item for the divisions.

TABLE IX.—1,340 CITIES AND TOWNS COMPARED WITH THE UNITED STATES, AND THE UNITED STATES EXCLUSIVE OF THESE CITIES AND TOWNS, BY GEOGRAPHIC DIVISIONS: 1900.

ITEMS.	Number of establishments.	Capital.	WAGE-EARNERS.		Miscellaneous expenses.	Cost of materials used.	Value of products.	Population.

¹ Exclusive of 395 establishments in Hawaii, 63 in Alaska, and 85 governmental in the District of Columbia.
² Exclusive of 63,592 persons in Alaska 154,001 in Hawaii, 392,060 in Indian Territory, 125,048 on Indian reservations, and 91,219 in the military and naval service (including civilian employees, etc.) stationed abroad.
³ Exclusive of 119 establishments in Honolulu and 85 governmental in District of Columbia.
⁴ Exclusive of Mount Holly, N. J., and Gretna, La., for which the population was not shown separately.

Attention is at once attracted to the close connection between the concentration of industry and the concentration of population as they appear in the New England states. In those states the 296 cities for which statistics

are shown contained 75.2 per cent of the population. The manufacturing establishments in the cities represented 80.8, their wages 90.5, and the value of their products 89.8 per cent of the totals for the geographic

division. The growth of the cities in these states, has been constant and dependent largely upon the development of their manufactures.

The territory included in the urban districts should also be considered in connection with the percentages shown in the above table. In the New England states a much larger proportion of the total area is included in the urban districts than in any of the other subdivisions. In many cases towns and villages have been included in the list of cities which contain areas that are rural rather than urban in character. Thus the large proportion of the territory in Massachusetts, Rhode Island, and Connecticut which is included by the census in the urban districts, explains in part the relatively large percentage of population and manufactures for those districts. In Maine, New Hampshire, and Vermont the conditions are somewhat reversed; the urban districts contain a comparatively small percentage of the population and a relatively larger proportion of the establishments and products. The entire territory of the District of Columbia is treated as urban, after the manner of many of the Massachusetts towns.

Different conditions surround the development of manufactures in the Southern and Western states. These conditions have tended to a wider distribution of the population, and to a development of those industries in which the products of agriculture form the chief materials, and which therefore do not depend so largely as do those of other states upon the amount of labor expended on products. The concentration of manufac-

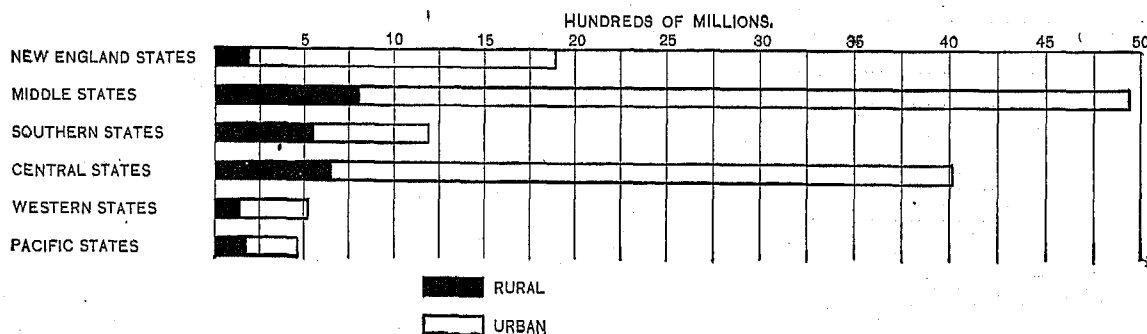

tures, therefore, is not attended by so marked a concentration in the population. The greatest difference between the concentration of population and manufactures in the urban districts is shown for the Western states, where the proportion of population in the urban districts was 20.3 per cent, while the average number of wage-earners formed 68.3 per cent of the total number, and the value of products was 73.8 per cent of the total value.

One of the principal features disclosed by the above table is the uniformity with which the concentration of products has exceeded the concentration in number of establishments. This is due to the fact that the average establishment in the urban districts is much larger than the average establishment in the rural districts. Reference to the statistics of manufacture by states will show that this rule holds everywhere except in Maryland, Nevada, Rhode Island, and Utah.

The statistics for the states, as given in the Report on Manufactures, Part II, disclose the further fact that in 9 states of the Union the urban population exceeded the rural population, while there are 22 states in which the number of establishments in the urban districts exceeded the number of establishments in the rural districts, and 34 in which the value of the urban products exceeded the value of the rural.

The relative importance of the urban and rural manufactures in each geographical division is graphically illustrated by the following diagram:

VALUE OF PRODUCTS OF URBAN AND RURAL MANUFACTURES: BY STATE GROUPS, 1900.

The proportion of manufactures in the urban and rural districts of each state is indicated by the accompanying diagram, which shows the proportion of urban to total products by states and territories.

7. *Wage-Earners*.—One of the characteristic features of the establishments in the urban districts is the relatively larger proportion of women reported as wage-earners. This fact is illustrated by table x, which shows the per cent which the men, women, and children, and their wages, respectively, constitute of the total for the 1,340 cities, and the country exclusive of these cities.

TABLE X.—Percentage of the average number of men, women, and children, and their wages, to total in urban and rural districts: 1900.

	PER CENT OF TOTAL.			
	Urban.		Rural.	
	Average number of wage-earners.	Wages.	Average number of wage-earners.	Wages.
Men	75.5	85.8	85.1	92.1
Women	21.5	18.2	10.8	6.6
Children	3.0	1.0	4.1	1.4

PROPORTION OF URBAN TO TOTAL PRODUCTS OF MANUFACTURES: 1900

The percentage of men to the total average number of wage-earners employed by the establishments in the rural districts was 9.6 greater than the corresponding percentage in the establishments in the cities. In the case of women wage-earners, these percentages are reversed, the percentage of women in the establishments in the cities being 10.7 greater than the corresponding percentage in the rural districts, showing clearly the greater predominance in the cities of industries in which female labor can be employed with advantage. While the proportion of the total wages paid men in the rural districts is in excess of the proportion for the cities, and the proportion paid women in the cities is in excess of that paid in the rural districts, the excesses are not so pronounced as in the case of the number of employees, being only 6.3 and 6.7 respectively.

The proportion of children in the urban and rural districts is about the same—3 and 4.1 per cent, respectively. In the predominance of men, women, or children employed in different localities depending largely on the character of the principal industries, a decided variation naturally appears in the totals for the different geographic divisions, as is shown by table XI, which gives the percentage that men, women, and children, respectively, form of the total wage-earners reported for each geographic division, for the urban districts in each division, and for the country outside of these districts.

TABLE XI.—Percentage of population in urban and rural districts compared with per cent of average number of wage-earners: United States by geographic divisions, 1900.

MFG—PT 1—XV

TABLE XI.—Percentage of population in urban and rural districts compared with per cent of average number of wage-earners: United States by geographic divisions, 1900—Continued.

	Popu- lation.	PER CENT OF TOTAL.					
		Men, 16 years and over.		Women, 16 years and over.		Children, under 16 years.	
		Aver- age num- ber.	Wages.	Aver- age num- ber.	Wages.	Aver- age num- ber.	Wages.
Western states.....	100.0	89.8	95.2	8.1	4.1	2.1	0.7
Urban.....	20.3	88.5	94.5	9.5	4.8	2.0	0.7
Rural.....	79.7	92.6	96.9	5.0	2.4	2.4	0.7
Pacific states.....	100.0	83.8	91.8	14.3	7.5	1.9	0.7
Urban.....	39.6	80.8	90.0	17.3	9.3	1.9	0.7
Rural.....	60.4	89.9	95.6	8.2	3.9	1.9	0.5

In the Western group of states the urban population forms only 20.3 per cent of the total population, while the average number of men employed in the urban manufactures of those states forms 88.5 per cent of the total wage-earners. In the New England states, on the other hand, where the urban population forms 75.2 per cent of the total population, the average number of men employed in the urban manufactures forms only 69 per cent of the total employees. The percentage of the urban population in the New England states is 54.9 higher and the percentage of men employed in the urban manufactures is 19.5 lower than in the Western states. These ratios are almost exactly reversed in the case of women wage-earners in the urban districts.

8. *Selected Industries.*—The preceding tables and discussion have indicated the extent of the concentration of industries in general in the urban districts. Some industries are almost necessarily rural at the present day because of the character of their raw material, and because of the conditions affecting the costs of transportation. If it costs more to haul the raw material from the country to the city, and back again to the country consumers, than can be saved through the superior efficiency of urban manufacturing organization, the industry, so far as it supplies rural demands, will tend to hold its own in the country districts. If the industry is of such a character that greater economy can be achieved by transporting the finished product rather than the raw material from the source of supply in the country to the market outside, it will tend to remain a rural manufacture. Instances of these conditions are to be seen in the case of lumber, turpentine, and rosin. The majority of manufactures, however, predominate in cities, because they can there

STATISTICS OF MANUFACTURES.

enjoy the advantages of convenient access to markets and to central distributing points; of a large ready supply of capital, labor, and power; and because they can there avail themselves of many other economies of production. This concentration is more marked in indus-

tries which are peculiar to cities, as is indicated by table XII, showing the per cent which the totals for the 73 selected industries in the 209 cities form of the totals for these industries in the United States at the census of 1900.

TABLE XII.—PER CENT OF 73 SELECTED INDUSTRIES IN 209 CITIES: 1900.

TABLE XII.—PER CENT OF 73 SELECTED INDUSTRIES IN 209 CITIES: 1900—Continued

73 SELECTED INDUSTRIES.	Number of establishments.	Capital.	SALARIED OFFICIALS, CLERKS, ETC.		AVERAGE NUMBER OF WAGE-EARNERS AND TOTAL WAGES.					Miscellaneous expenses.	Cost of materials used.	Value of products.
			Number.	Salaries.	Total.		Average number.					
					Average number.	Wages.	Men, 16 years and over.	Women, 16 years and over.	Children, under 16 years.			
Ship and boat building, wooden.....	39.4	58.9	61.3	62.0	52.5	54.9	52.3	70.6	98.1	65.3	43.2	51.4
Shipbuilding, iron and steel.....	79.5	67.4	80.4	75.7	73.2	74.6	73.5	29.4	63.1	80.0	77.4	78.5
Shirts.....	77.5	80.0	81.0	84.1	69.4	76.9	81.1	67.4	50.6	89.5	82.1	81.2
Silk and silk goods.....	62.7	56.3	61.2	62.7	60.9	66.0	62.4	61.1	53.8	66.6	54.1	61.9
Slaughtering and meat packing, wholesale.....	71.6	88.3	92.3	92.4	89.2	90.8	89.0	95.4	80.3	94.6	88.5	88.5
Slaughtering, wholesale, not including meat packing.....	71.0	94.1	91.4	92.7	87.8	89.7	88.1	60.0	47.5	93.4	89.8	89.7
Soap and candles.....	70.8	79.3	89.2	88.0	86.6	85.7	85.8	86.4	93.8	78.9	86.6	85.7
Steam fittings and heating apparatus.....	81.1	89.2	87.3	86.6	87.3	88.9	87.3	84.4	97.4	88.7	86.0	87.7
Tobacco, chewing, smoking, and snuff.....	49.9	69.3	68.7	69.0	62.3	74.1	60.9	72.3	34.2	70.5	77.0	75.9
Tobacco, cigars and cigarettes.....	58.3	68.5	73.3	78.7	69.4	70.7	64.8	77.8	60.4	75.2	70.1	71.6
Trunks and valises.....	93.1	90.9	92.7	91.9	91.6	92.3	91.4	89.4	97.8	91.4	91.5	91.4
Umbrellas and canes.....	94.3	93.9	94.4	93.8	94.4	95.1	92.0	95.8	99.6	98.3	97.5	97.1
Wirework, including wire rope and cable.....	64.0	57.7	59.3	62.1	64.3	64.1	63.1	67.6	87.9	62.6	58.4	60.2
Wood, turned and carved.....	47.8	43.6	41.5	44.0	48.1	48.0	43.7	16.2	51.3	55.5	46.0	46.5
Woolen goods.....	19.5	32.6	34.6	37.3	35.7	35.8	32.6	39.6	43.9	36.0	37.9	37.2
Worsted goods.....	55.4	74.9	71.6	73.9	74.0	72.7	70.9	77.2	73.6	75.3	71.3	72.2

The table shows that the establishments engaged in the 73 industries located in the 209 cities form 41.4 per cent, their wage-earners 63.7 per cent, and the value of their products 66.8 per cent of the totals for all establishments engaged in these same industries. Computations from tables in the Report on Manufactures, Part II, show that the 73 selected industries have 28.1 per cent of the total number of establishments for all industries, 64.4 per cent of the total wage-earners, and produce 62.4 per cent of the total value of products for these cities. These industries in the country as a whole represent a very large proportion of the total for all industries, and the urban establishments engaged in them represent a large proportion of the totals for the same industries. They are, therefore, representative of urban concentration, and the statistics of these industries are of peculiar importance.

In the case of one of the industries, "clothing, men's, factory product, buttonholes," all the establishments are located in the 209 cities. With this exception, the largest proportion of city establishments is reported for "lithographing and engraving," in which the city establishments represent 97.3 per cent of the total number in the United States. The next largest concentration, 95.3 per cent of the whole, is shown for "clothing, women's, factory product," and the next, 94.6 per cent, for "hats and caps, not including fur hats and wool hats."

With the exception noted above, the greatest concentration in the average number of wage-earners is for "lithographing and engraving," which has 95.5 per cent of its employees in city establishments; the next, 94.8 per cent, for "cars, and general shop construction and repairs by street railroad companies;" and the next, 94.4 per cent, for "umbrellas and canes."

"Bags, other than paper," shows the second greatest

concentration in the value of products, the 209 cities representing 98.5 per cent of the products for all establishments in the industry. The next greatest concentration in value of products, 97.1 per cent, is for "umbrellas and canes;" and the next, 96.6 per cent, for "lithographing and engraving."

The smallest degree of concentration in number of establishments is shown for "flouring and grist mills," in which the establishments in the 209 cities form but 3 per cent of the total number. The next smallest percentage, 5.7, appears in the case of "liquors, distilled;" and the next, 10.4, in "brick and tile." The least concentration in wage-earners and value of products is shown for "liquors, vinous," which reports only 12.6 per cent of its wage-earners and 10.2 per cent of its products in urban establishments. The next smallest degree of concentration in the number of wage-earners, 23.2 per cent, and also in value of products, 25.5 per cent, is shown for "brick and tile;" and the next, 25.2 per cent, in number of wage-earners and 30.8 per cent in value of products, for "flouring and grist mill products."

There are striking variations in the proportions which various items bear to the totals for the respective industries. It appears, however, that in the majority of instances larger percentages are reported for capital, wages, etc., than for the number of establishments, indicating a probability that the establishments in the cities are relatively larger than those in the rural districts.

A division of the industries into 15 groups, as explained in Chapter II of this introduction, according to the character of the raw material or the use of the products, leads to interesting results. Table XIII shows the percentages which the totals for each group of industries in the 209 cities constituted of the totals in the United States for the same group.

STATISTICS OF MANUFACTURES.

TABLE XIII.—Per cent of 15 groups of industries in 209 cities: 1900.

Group No.	15 INDUSTRY GROUPS.	Number of establishments.	Capital.	WAGE-EARNERS.		Cost of materials used.	Value of products.
				Average number.	Total wages.		
	Total.....	43.2	60.8	60.1	63.9	62.2	63.5
1	Food and kindred products.....	28.2	63.6	62.9	66.9	66.9	66.4
2	Textiles.....	47.5	61.8	64.4	69.7	70.8	71.2
3	Iron and steel and their products.....	60.6	62.8	65.0	66.1	59.9	62.1
4	Lumber and its manufactures.....	15.0	28.5	33.7	38.1	33.9	34.9
5	Leather and its finished products.....	31.2	49.8	58.8	60.1	55.2	56.6
6	Paper and printing.....	47.1	62.0	63.2	73.6	63.5	73.6
7	Liquors and beverages.....	43.6	81.5	75.6	79.9	75.2	78.6
8	Chemicals and allied products.....	61.6	60.8	58.0	59.2	68.0	67.6
9	Clay, glass, and stone products.....	26.5	34.5	33.3	36.9	46.1	40.7
10	Metals and metal products other than iron and steel.....	53.1	64.2	70.7	69.9	50.8	55.2
11	Tobacco.....	67.3	65.4	65.5	69.8	65.4	70.1
12	Vehicles for land transportation.....	34.2	61.5	57.0	58.4	59.0	59.1
13	Shipbuilding.....	40.9	65.4	66.2	67.7	67.3	69.7
14	Miscellaneous industries.....	56.3	75.7	62.5	67.5	70.2	70.5
15	Hand trades.....	60.0	64.7	70.6	74.1	70.2	71.7

The greatest concentration in respect to number of establishments appears in the group "chemicals and allied products," in which the establishments in the cities formed 61.6 per cent of the total. The greatest concentration as to value of products, 78.6 per cent, is shown for "liquors and beverages." "Lumber and its manufactures" shows the least concentration in number of establishments, those in the 209 cities forming only 15 per cent of the total number reported; but the value of products reported for this comparatively small number of establishments formed 34.9 per cent of the total.

The decrease of the concentration in the principal industries during the last decade can be observed by comparing the principal industries shown for the 165 cities for which the statistics were published separately at the census of 1890, with the totals for the same industries in the same cities at the census of 1900. A comparison of this kind is made in table xiv, which shows the proportion the items of manufacture in each of 49 selected industries in the 165 cities at the censuses of 1890 and 1900, respectively, bore to the totals for the whole country in the same years.

TABLE XIV.—49 SELECTED INDUSTRIES IN 165 PRINCIPAL CITIES,¹ PER CENT OF THE UNITED STATES: 1890 AND 1900.

49 SELECTED INDUSTRIES.	Year.	Number of establishments.	Capital.	WAGE-EARNERS.		Miscellaneous expenses.	Cost of materials used.	Value of products.
				Average number.	Total wages.			
United States.....	1900	43.7	61.7	62.5	66.6	74.5	61.2	63.1
	1890	50.3	65.2	66.9	70.9	74.6	65.6	68.6
Agricultural implements.....	1900	22.7	56.7	56.0	57.7	64.1	58.1	57.7
	1890	21.4	57.7	51.3	51.0	55.9	55.1	64.5
Awnings, tents, and sails.....	1900	73.1	90.3	88.9	90.0	92.8	92.9	91.9

	1890	64.2	54.5	58.6	65.0	69.3	58.3	61.3
Woolen goods.....	1900	17.7	29.2	32.2	32.2	33.2	35.0	34.1
	1890	16.8	29.4	32.3	32.2	29.1	32.3	32.6

²Inclusive in 1900 of "leather, morocco," and "leather, patent and enameled," which were separately reported in 1890.

The percentages for 1890 are based on totals which include Lincoln, R. I., as it was found impossible to segregate the figures for all the industries in the city. The omission of this city from the totals for 1900 has had a slight effect on the percentages for some of the industries. The inclusion, in 1900, of "leather, morocco," and "leather, patent and enameled," under the head of "leather, tanned, curried, and finished," should also be taken into account.

The 49 industries shown in table xiv, are important factors in the industrial development of the country. In 1900 the establishments reported for these industries constituted 22.0 per cent, their wage-earners, 42.9 per cent, and their products 41.7 per cent of the total for all industries in the United States. The increase or decrease in their concentration in the cities is therefore especially significant.

Comparing the percentages in the country at large for the two censuses, it appears that there has been a marked decrease in the proportion which each item bears to the corresponding total, with the exception of miscellaneous expenses, and in this item there was no change. As to the industries in general, therefore, it appears that concentration has decreased during the decade. The same can not be said, however, of every one of the industries. The proportion of the total number of establishments located in the cities has increased in 7 of the 49 industries and has decreased in 41 of them. Eleven of the industries show an increase in the proportion of the products in the cities, while 38 show a decrease.

The greatest increase in concentration appears for "hats and caps, not including fur hats and wool hats." Although there were already 85.5 per cent of the establishments in this industry in the 165 principal cities at the census of 1890, the percentage increased still further to 93.6 in 1900. The value of the products of the city establishments in this industry in 1890 formed 60.3

per cent of the total value of products for the industry, and in 1900, 80.2 per cent. The 4 industries which show the next largest increase in the proportion of establishments in the cities are, in their order, "leather, tanned, curried, and finished;" "tobacco, chewing, smoking, and snuff;" "rubber and elastic goods," and "boots and shoes, factory product." All these industries except "boots and shoes," also show increased concentration as measured by value of products. The 5 industries which show the largest decrease in the proportion of establishments in the cities are, in their order, "baskets, rattan and willow ware;" "chemicals;" "cutlery and edge tools;" "wood, turned and carved," and "silk and silk goods."

It therefore appears that in the majority of the industries the tendency has been toward a wider diffusion of the establishments, although the decrease in the proportion of the number of establishments in cities may be due to some extent to combinations of one or more establishments under a single management, or a growth in the size of independent establishments without such consolidation. That the decrease in the proportion of city establishments is partly due to such consolidation or growth is indicated by the fact that while 41 industries show a relative decrease in the number of city establishments, only 38 show a relative decrease in the value of the products of such establishments.

9. *Rank of Cities.*—The relative importance of the principal cities as manufacturing centers is shown by the accompanying diagram, in which the leading cities are arranged according to the value of their products of manufactures.

Table xv shows the relative rank of the 100 principal cities in number of establishments, amount of capital, average number of wage-earners, total wages and value of products, as reported at each census from 1880 to 1900, inclusive, together with the figures for these items in the case of each city.

TABLE XV.—100 PRINCIPAL CITIES, ARRANGED ACCORDING TO GROSS VALUE OF PRODUCTS, SHOWING RANK BY ESTABLISHMENTS, CAPITAL, WAGE-EARNERS, AND PRODUCTS: 1880, 1890, AND 1900.

The arrangement of the cities in the table is based on their rank in gross value of products as reported at the census of 1900. The rank of a city in number of establishments is controlled largely by the number of reports secured from the hand trades or neighborhood industries of the city. A large number of reports from the small

shops engaged in these industries tends to raise the rank of the city in number of establishments, but does not have a corresponding effect on its rank in respect to capital, wage-earners, wages, etc. For instance, the city of Grand Rapids, Mich., ranked forty-second in number of establishments and only fifty-sixth in value

of products. The relatively high rank in number of establishments is explained by the fact that of the 824 establishments reported, 347 were small shops.¹

The gross value of products is not a true indication of the relative importance of the manufacturing industries of a city. In a number of cases the controlling industries are of a character in which materials form a large proportion of the value of the products, and in which, therefore, there is a comparatively small expenditure for labor, machinery, power, etc. The gross value of products, therefore, does not indicate the extent of the manufacturing forces expended upon its production. As previously explained, it is impracticable to compute the net value of the products of manufacture for the different cities by deducting the cost of materials purchased in the raw state. But if the total cost of materials were deducted from the gross value of the products, the remainder would be generally a truer indication of the amount added to the cost of materials. When the products for the different cities are treated in this manner, there is a considerable change in the ranking. For instance, in 1900 San Francisco ranked eleventh in gross value of products, but if the table were made in the manner suggested the rank of the city would be reduced to thirteenth. Minneapolis, Minn., would be reduced from fifteenth to twentieth place; Lawrence, Mass., from twenty-eighth to thirty-seventh; Lynn, Mass., from thirty-first to forty-fourth; Denver, Colo., from thirty-second to forty-third; Cambridge, Mass., from thirty-fifth to forty-seventh; Somerville, Mass., from fifty-seventh to eighty-third. One of the most notable changes in this respect appears in the case of St. Joseph, Mo., the rank of which would be reduced from forty-fifth to sixty-ninth. In a number of cities, conversely, this deduction of cost of materials from gross value of products would result in advancing their rank. For instance, Newark, N. J., would advance from twelfth to eleventh place; Terre Haute, Ind., from fiftieth to thirty-second; Washington, D. C., from thirty-eighth to twenty-ninth; and Dayton, Ohio, from forty-second to thirty-fifth. It is therefore evident that for closely determining the rank of cities, the character of their predominating industries should be considered.

The rank of the cities according to the average number of wage-earners is a more accurate indication of their relative importance as manufacturing centers than is the rank in gross value of products.

10. *Cities and States Compared.*—Table xv indicates the relative importance of the different cities as compared with each other. The importance of the manufactures in the large cities is shown from another point of view by table xvi, which gives the population

¹ The subject of hand and building trades is treated on page cxxi et seq.

and the gross value of the manufactures in the 38 principal cities in population, and shows in each case the number of states for which the value of products is less than that reported for each city. The cities in this table are ranked, relative to each other, according to the value of products.

TABLE XVI.—Principal cities and number of states outranked by each in value of products: 1900.

CITIES.	VALUE OF PRODUCTS.			Population.
	Total.	Rank.	Number of states outranked in value of products.	
New York, N. Y.	\$1,371,358,468	1	49	3,437,202

Saranton, Pa.	27,646,418	36	11	102,026
Los Angeles, Cal.	21,237,637	37	10	102,479
Memphis, Tenn.	17,923,059	38	9	102,326

The products of manufactures of the city of New York amounted to \$1,371,358,468. This value was in excess of that reported for each of the 51 states and territories except New York and Pennsylvania. The products of the city of Boston were valued at \$206,081,767, being in excess of the products reported for each of 37 states. A similar comparison for each of the cities is shown in the above table, which indicates for each its relative importance as a manufacturing community in the United States as compared with the total value of products for the different states and territories.

11. *Leading Industries in Principal Cities.*—Tables xvii and xviii show the statistics for the 6 leading or characteristic industries in each of 25 selected cities, and the statistics of the 6 leading cities in each of 15 selected industries, the industries reporting the greatest value of product being regarded as the characteristic industries of a city. These tables are comparative, the industries and cities being shown for the censuses of 1890 and 1900.

STATISTICS OF MANUFACTURES.

TABLE XVII.—RANK OF 6 PRINCIPAL INDUSTRIES

	CITIES.	Year.	INDUSTRIES, RANK.	
			First.	Second.
1	New York, N. Y. (boroughs of Manhattan and Bronx).....	1900	Clothing, women's, factory product	Clothing, men's, factory product
		1890	Clothing, men's, factory product	Clothing, women's, factory product
2	Chicago, Ill	1900	Slaughtering and meat packing, wholesale ..	Foundry and machine shop products
		1890	Slaughtering and meat packing, wholesale ..	Clothing, men's, factory product
3	Philadelphia, Pa	1900	Foundry and machine shop products	Sugar and molasses, refining
		1890	Sugar and molasses, refining	Foundry and machine shop products
4	Brooklyn, N. Y. (borough of Brooklyn)	1900	Sugar and molasses, refining	Foundry and machine shop products
		1890	Sugar and molasses, refining	Foundry and machine shop products
5	St. Louis, Mo.....	1900	Tobacco, chewing, smoking, and snuff	Slaughtering and meat packing, wholesale ..
		1890	Liquors, malt	Tobacco, chewing, smoking, and snuff
6	Boston, Mass.....	1900	Sugar and molasses, refining	Printing and publishing, newspapers and periodicals ..
		1890	Clothing, men's, factory product	Sugar and molasses, refining
7	Pittsburg, Pa.....	1900	Iron and steel	Foundry and machine shop products
		1890	Iron and steel	Foundry and machine shop products
8	Baltimore, Md	1900	Clothing, men's, factory product	Fruits and vegetables, canning and preserving ..
		1890	Clothing, men's, factory product	Masonry, brick and stone
9	Cincinnati, Ohio	1900	Clothing, men's, factory product	Foundry and machine shop products
		1890	Clothing, men's, factory product	Liquors, distilled
10	Cleveland, Ohio.....	1900	Iron and steel	Foundry and machine shop products
		1890	Iron and steel	Foundry and machine shop products
11	San Francisco, Cal	1900	Sugar and molasses, refining	Foundry and machine shop products
		1890	Sugar and molasses, refining	Foundry and machine shop products
12	Newark, N. J	1900	Leather, tanned, curried, and finished	Liquors, malt
		1890	Liquors, malt	Leather, patent and enameled
13	Milwaukee, Wis.....	1900	Foundry and machine shop products	Liquors, malt
		1890	Liquors, malt	Leather, tanned, curried, and finished
14	Buffalo, N. Y	1900	Slaughtering and meat packing, wholesale ..	Foundry and machine shop products
		1890	Slaughtering and meat packing, wholesale ..	Foundry and machine shop products
15	Minneapolis, Minn.....	1900	Flouring and grist mill products	Lumber and timber products
		1890	Flouring and grist mill products	Lumber and timber products
16	Detroit, Mich	1900	Foundry and machine shop products	Druggists' preparations, not including prescriptions ..
		1890	Cars, steam railroad, not including operations of railroad companies ..	Foundry and machine shop products
17	Providence, R. I	1900	Worsted goods	Jewelry
		1890	Worsted goods	Foundry and machine shop products
18	Louisville, Ky	1900	Tobacco, chewing, smoking, and snuff	Oil, cottonseed and cake
		1890	Tobacco, chewing, smoking, and snuff	Foundry and machine shop products
19	Jersey City, N. J	1900	Tobacco, chewing, smoking, and snuff	Slaughtering, wholesale, not including meat packing ..
		1890	Slaughtering, wholesale, not including meat packing ..	Foundry and machine shop products
20	Rochester, N. Y	1900	Clothing, men's, factory product	Boots and shoes, factory product
		1890	Clothing, men's, factory product	Boots and shoes, factory product
21	Indianapolis, Ind.....	1900	Slaughtering and meat packing, wholesale ..	Foundry and machine shop products
		1890	Slaughtering and meat packing, wholesale ..	Flouring and grist mill products

Table xvii shows the characteristic industries for the principal cities and the changes which have taken place in these industries during the last decade. As a rule the same industries appear as the leading industries for both censuses, but in some of the cities a number of changes have occurred. For instance, in Philadelphia, "sugar and molasses refining" was the leading industry in 1890, while "foundry and machine shop products" takes the first place in 1900. In St. Louis the manufacture of "liquors, malt" was the principal industry in 1890, while "tobacco, chewing, smoking and snuff" occupies the first place in 1900 with "liquors, malt" in the third place. "Foundry and machine shop products" occupies a very important position in each of the 25 selected cities. It stands first in 4 cities, second in 10, third in 3, and fourth in 6. "Iron and steel," the class which includes the products of blast furnaces and rolling mills, ranks second in value of products in the industries of the United States, but occupies first place in only 3 cities, and does not appear higher than the fourth place in any other city.

Comparing the leading industries of 1900 with the same industries for 1890, it appears that "slaughtering and meat packing, wholesale," occupies the first position in 3 cities, "sugar and molasses refining," the first place in 3 cities, and "iron and steel" the first place in 3 cities for both decades. "Foundry and machine shop products" shows the greatest advance in this regard, being first in 4 cities in 1900, as compared with first in 1 city in 1890. "Clothing, men's, factory product," first in 5 of the cities in 1890, was superseded in New York city in 1900 by "clothing, women's, factory product," which industry was second in 1890, and in Boston, Mass., by "sugar and molasses refining," which industry was also second in the previous decade.

The most radical changes in rank occur in Boston, Mass., where "clothing, men's, factory product," ranked first in 1890, dropped to fourth place in 1900; in Milwaukee, Wis., where "foundry and machine shop products" changed from fourth place in 1890 to first in 1900; in Detroit, Mich., where "cars, steam railroad, not including operations of railroad companies," first in 1890, has fallen below sixth place.

Table xviii shows the 6 cities reporting the largest value of products for each of the 15 selected industries at the censuses of 1890 and 1900, and indicates the principal producing centers for each industry. For instance, Chicago, Ill., Kansas City, Kans., and South Omaha,

Nebr., are the 3 principal producing centers for "slaughtering and meat packing, wholesale," while Fall River, Lowell, and New Bedford, Mass., are the principal producing centers for "cotton goods." In this table the largest cities as a rule occupy the first position, New York taking first rank in 6 of the 15 industries in 1890 and in 8 in 1900. Chicago occupied first place in 4 industries in 1890 and in 2 in 1900. The exceptions to this rule appear in cases where industries are largely localized in certain cities. For instance, Brockton, Lynn, and Haverhill, Mass., comparatively small cities in population, occupy the first 3 positions in the manufacture of "boots and shoes, factory product," and Paterson, N. J., occupies first position in the manufacture of "silk and silk goods."

II.

HAND AND BUILDING TRADES.

1. *Hand trades.*—The industries included in the group of "hand trades" were conducted principally in small shops engaged in general repair work or in producing goods on a small scale for the benefit of the community in which they were located. The group also includes the operations of building contractors and others engaged in building operations. The value of the products therefore represents the amount received for work done. The operations are not in a strict sense manufacturing, and the industries have been included in the census reports to comply with the law, which specifies that the statistics to be taken are those that relate to "manufacturing and mechanical industries."

The hand and building trades are, in great measure, peculiar to cities. Of the 215,814 establishments reported for these industries in the United States, 107,970 or 50 per cent, were in the 209 cities with a population of 20,000 or more. A large proportion of the remaining 50 per cent are contained in the reports for the other cities and towns, 1,131 in number; but for these the statistics are not given by industries, and the total for the hand trades can not therefore be shown. The extent to which the inclusion of the statistics for these trades has affected the totals for manufactures is shown by table xix, which gives the totals, as reported at the censuses of 1890 and 1900 for the United States; for the 164 principal cities; and for the United States outside of these cities, the total for each being subdivided so as to show the statistics for the manufactures and the hand trades respectively.

¹Exclusive of 395 establishments in Hawaii, 63 in Alaska, and 85 Governmental in District of Columbia.

²Exclusive of 10 establishments in Alaska.

³Exclusive of 119 establishments in Honolulu, H. I.

As explained on page ccxx, the 164 principal cities were the only cities for which statistics were shown by industries at the census of 1890, and therefore are the only ones for which the totals for the hand trades can be presented in comparison with the totals for similar trades at the census of 1900.

At the census of 1890 some of the industries shown as hand trades were, in a few cities, included in the group of "all other industries." It is now impossible to segregate the data for these industries. Their omission, however, from the above table will not materially affect the percentages or conclusions.

Of the 512,191 establishments in the country as a whole, 215,814, or 42.1 per cent, were reported for the hand trades at the census of 1900. At the census of 1890 the hand trades numbered 139,134, or 39.1 per cent of the total. The proportions of the hand trades to the total, both in the United States and in the 164 cities, at the census of 1890 were considerably in excess of the proportions for 1900, with the single exception that the proportion of the number of establishments reported for the hand trades in 1900 was in excess of that for 1890. For the districts outside of the 164 cities these percentages are reversed, the larger proportion appearing for the hand trades in 1900. Moreover, reports were secured in 1890 for some lines of industry that were omitted in 1900.

MFG—PT 1—XVI

It is also to be noted that a larger number of cities were canvassed by special agents in 1900, and therefore a larger percentage of reports were secured for these trades in the districts outside of the 164 cities, thus increasing the proportion for those districts. In each of the 3 divisions shown in the table, the proportion which the number of establishments reported for the hand trades bears to the total is very much in excess of the proportion which the capital, wage-earners, wages, materials, and products for these trades bear to the totals for these items. Therefore, with the exception of number of establishments, the omission of statistics for hand trades would have but slight effect on the statistics of the manufacturing industries of the United States or of any of its subdivisions. For instance, their omission from the total for the United States for 1900 would reduce the average number of wage-earners by 10.5 per cent, and the value of products by 9.1 per cent, while their omission from the 164 cities would reduce the corresponding items by only 12.5 and 10.4 per cent, respectively, and in the districts outside the cities by 8 and 7.1 per cent, respectively.

The effect of the inclusion of statistics for hand trades in the totals for the 209 cities with a population of 20,000 or over at the census of 1900 is shown by table xx, in which the totals for these cities are divided between manufactures and hand trades.

STATISTICS OF MANUFACTURES.

TABLE XX.—MANUFACTURES AND HAND TRADES IN 209 CITIES, WITH PERCENTAGES WHICH EACH FORM OF THE TOTAL: 1900.

ITEMS.	Total.	Manufactures.	Hand trades.	PER CENT OF TOTAL.	
				Manu- factures.	Hand trades.
Number of establishments.....	221,532	113,562	107,970	51.3	48.7
Capital.....	\$5,965,011,612	\$5,711,019,020	\$253,992,592	95.7	4.3
Average number of wage-earners.....	3,188,979	2,794,159	394,820	87.6	12.4
Total wages.....	\$1,483,100,988	\$1,209,603,553	\$213,497,435	85.6	14.4
Cost of materials used.....	\$4,566,056,017	\$4,227,405,418	\$338,650,599	92.6	7.4
Value of products.....	\$8,259,821,644	\$7,410,949,801	\$848,871,843	89.7	10.3

Of the 221,532 establishments reported for the 209 cities, 107,970, or 48.7 per cent, were for the hand trades. Yet this large percentage of establishments represents only 4.3 per cent of the capital, 12.4 per cent of the wage-earners, 14.4 per cent of the wages, and 10.3 per cent of the products.

As the hand trades represent nearly half the establishments reported for these cities, their omission from the canvass would reduce its cost by almost one-half; it would also greatly reduce the expense of office work in compiling statistics. The results would be in all respects of equal value in showing the actual condition of the manufactures of cities.

Because of the impracticability of conducting the canvass for the collection of the reports from hand trades on uniform lines, their inclusion impairs the comparability of different censuses in this regard. In a

number of instances the increase or decrease in number of establishments from census to census is entirely due to this lack of uniformity. The agents in a given city at the census of 1890 may have been very careful to secure reports for all small shops, and if the agents in 1900 did not exercise equal care, a decrease in number of establishments would appear, although there may have been a great increase in all other particulars.

The impracticability of making a thorough canvass for hand trades in the entire country on uniform lines also prevents an accurate showing of the relative standing of the different cities, counties, and states at the same census. This is illustrated in table XXI, which gives the total number of reports received for the different hand trades in each of the 209 cities with a population of 20,000 or more at the census of 1900, the cities being arranged in the order of their population.

TABLE XXI.—NUMBER OF ESTABLISHMENTS REPORTED FOR HAND TRADES IN 209 CITIES WITH A POPULATION OF 20,000 AND OVER: 1900.

209 CITIES (ARRANGED IN ORDER OF POPULATION).	Popu- lation.	Total number of estab- lish- ments, all in- dustries.	HAND TRADES—NUMBER OF ESTABLISHMENTS.

The number of establishments reported is the number returned at the census of 1900 as having a product valued at \$500 or more during the census year. In all cities with approximately the same population, located in the same section of the country and with similar industries predominating, the number of reports secured for the hand trades should be about the same, yet it is apparent from the table that this is not the case. The lack of uniformity in this respect is due in the majority of cases to the fact that the agents in the different cities did not give the same construction to their instructions, or neglected to make a thorough canvass of industries of this character, considering them of comparatively slight importance.

In the city of Chicago, with a population of 1,698,575, reports were received from 19,203 establishments. Of this number, 10,310, or 53.7 per cent, were for the hand trades. In the city of Philadelphia, with a population of 1,293,697, reports were received for 15,887 establishments, and of this number 6,676, or 42 per cent, were for the hand trades. The disproportion in the population of the two cities will not account for the disproportion in the number of reports received for the hand trades. The excess in the number of shops reported for Chicago appears in each of the hand trades specified, with the exception of paper hanging. For this industry, only 21 returns were received for New York and 57 for Chicago, as against 302 for Philadelphia. Paper hanging is often carried on in connection with house and sign painting, and the lesser number of reports for paper hanging in New York and Chicago may be thus accounted for.

The city of Cleveland, Ohio, with a population of 381,768, reported 1,294 establishments for the hand trades, or 44.2 per cent of the total; while for Buffalo,

which has a population of 352,387, there were reported 2,073, or 53.1 per cent of the total. The excess in population of Cleveland over Buffalo was 29,381; nevertheless, 779 more hand trades establishments were reported for Buffalo. The disproportion in number of returns for these 2 cities is even greater in some of the individual trades. Only 42 returns were secured for "clothing, women's dressmaking," in Cleveland, against 303 in Buffalo; only 8 were secured for "masonry, brick and stone" in Cleveland, against 89 in Buffalo.

Striking as are the disproportions in the total number of reports for all hand trades, the disproportion in the number of returns for particular hand trades in different cities is even more noticeable. For instance, 117 reports were received for "masonry, brick and stone" in Cincinnati, Ohio, which has a smaller population than Cleveland, Ohio, where, notwithstanding, only 8 reports were secured. Eight reports were also secured for this industry in the city of San Francisco, Cal., as against 15 for Los Angeles, Cal., yet the latter city has a population less than one-half that of San Francisco. In the case of "blacksmithing and wheelwrighting," 83 reports were received for Pittsburg, Pa., which has a population of 321,616; while 130 were reported for Detroit, Mich., 111 for Milwaukee, Wis., 156 for Washington, D. C., and 101 for Newark, N. J., each of which has a smaller population than Pittsburg.

Such comparison of the statistics of all trades in any two of the cities, or of those of any one trade in different cities, leads to the conclusion that there has been no uniformity in the canvass, and that the figures are worthless for comparative purposes. They do not show actual conditions in these trades in any city or state.

The establishments in the group of "hand trades"

may be further divided into those engaged in the building trades, such as "carpentering," "masonry, brick and stone," "painting, house and sign," etc.; "paper hanging," "plastering and stucco work," and "plumbing and gas and steam fitting," and those engaged in general repair work and manufacturing on a small scale to meet the demands of the immediate neighborhood.

The instructions to the special agents and enumerators required them to secure reports from all contractors engaged in carpentering, masonry, and other building operations, but not from journeymen working for hire in these trades. If the instructions had been strictly complied with, the number of the reports secured would indicate, in a measure, the extent of the building operations of the different cities. The value of the products included in these reports, however, is no indication of the value of the building operations. From the nature of the reports, the combined products of the different schedules would be in excess of such operations, provided returns had been secured from all contractors and subcontractors, because of the duplication in the value of products. For instance, a report is secured from a contractor who is engaged in extensive building operations during the census year. This report represents, or should represent, the entire amount of the year's work. During the year, however, the contractor has given a number of subcontracts to carpenters, plasterers, painters, etc.; each one of these subcontractors is also required to make a report, representing the value of his operations during the year. The combination of these several reports results in a duplication not only of products, but possibly of wage-earners, wages, and materials. Under these conditions, therefore, the returns can not be accepted as any indication of the actual operations involved.

2. *Building Trades.*—Of the 215,814 establishments reported for hand trades in the United States, 58,463, or 27.1 per cent, were for the building trades. Table xxii shows the statistics for building trades as reported for the United States, for the 209 cities, and for the United States exclusive of these cities.

TABLE XXII.—*Building trades in 209 cities compared with the United States, and the United States exclusive of these cities.*

ITEMS.	United States.	209 CITIES.		UNITED STATES, EXCLUSIVE OF 209 CITIES.	
		Total.	Per cent of United States.	Total.	Per cent of United States.
Number of establishments.....	58,463	36,875	63.0	21,588	37.0
Capital.....	\$193,725,036	\$147,508,692	76.1	\$46,156,944	23.9
Wage-earners.....	380,060	238,917	72.3	91,743	27.7
Wages.....	\$190,898,680	\$142,992,620	75.0	\$47,906,060	25.0
Miscellaneous expenses.....	\$88,565,905	\$77,792,683	87.8	\$10,773,222	12.2
Cost of materials used.....	\$321,339,847	\$232,298,478	72.3	\$89,041,369	27.7
Value of products.....	\$739,944,811	\$556,014,400	75.0	\$184,930,411	25.0

While the establishments reported for building trades formed only 27.1 per cent of the 215,814 hand-trade establishments in the United States, the amount of capital constituted 49.4 per cent, and the number of wage-earners 59.1 per cent, their wages 66.3 per cent, and the value of products 62.5 per cent. Except in number of establishments and amount of capital, therefore, the building trades represented the larger proportion of all the items reported in the general group.

It appears from the table that 63 per cent of the establishments reported for the building trades were located in the 209 cities. These establishments controlled 72.3 per cent of the wage-earners, 75 per cent of the wages, and 75 per cent of the total value of products reported for these trades in the United States. It is evident, therefore, that the building trades so far as they were returned to the Census Office were restricted in the main to the urban districts. Practically all the remaining establishments are undoubtedly included in the reports for the 1,181 cities and towns, for which statistics are not shown by specified industries.

Realizing the fact that the reports for the building trades did not show the actual condition of the building operations of the respective cities during the census year, the Census Office endeavored to secure reports from the officials of each city, showing the estimated cost of the buildings erected during the year ending May 31, 1900. Letters requesting such information met with favorable response from 109 cities. Table xxiii shows the reported estimated cost of the buildings erected in these cities during the census year, in comparison with the value of the products for the building trades in each as reported in the regular census.

TABLE XXIII.—*Estimated cost of buildings erected during the census year compared with the value of products reported for the building trades.*

In all but 16 of the cities shown in this table the value of products reported for the building trades was in excess of the estimated cost of the buildings erected during the census year. In the majority of the 16 cities for which the estimated cost of the buildings is in excess of the value of the products of the building trades, it appears that the canvass for the collection of reports for the hand trades was exceptionally defective. For instance, in the city of Birmingham, Ala., for which the estimated cost of buildings erected amounted to \$741,130, and the reported value of products in the building trades to \$457,725, it appears that reports were secured from only 1 establishment engaged in "masonry, brick and stone," 13 in "carpentering," 2 in "painting," 1 in "paper hanging," and 9 in "plumbing and gas and steam fitting." In Jacksonville, Fla., where the estimated cost of the buildings erected was \$232,910, and the value of the products for the building trades was \$198,935, no reports were received for "masonry, brick and stone," nor for "paper hanging," and only 2 returns for "painting, house, sign, etc.," 5 for "carpentering," and 9 for "plumbing and gas and steam fitting."

At all prior censuses the statistics for hand and building trades have been included indiscriminately with those for manufacturing industries, but at the census of 1900 an effort has been made to segregate them, and wherever practicable the totals for these trades have been grouped under the head of "hand trades" and shown separately. To assist in preserving this distinction in the principal cities, table xxiv is presented, which gives separate totals for the manufactures and hand trades, respectively, for each of the 209 cities with a population of 20,000 or more at the census of 1900.

STATISTICS OF MANUFACTURES.

TABLE XXIV.—MANUFACTURES AND HAND TRADES FOR PRINCIPAL CITIES: 1890 AND 1900.

III.

DEVELOPMENT OF INDUSTRIAL CENTERS.

1. *Suburban Establishments.*—The growth of population and manufactures in the counties in which the 100 principal cities are located may be accepted as indicating the extent of the concentration in the principal centers of industry. The adoption of the limits of the county rather than the corporate limits of the city as the line of demarcation obviates, in a majority of instances, the objection to limiting the territory of the industrial unit to the boundaries of the small political unit, the city. The establishment of manufactures in the suburbs of the principal cities has tended to enlarge each of these industrial cities far beyond its corporate limits. Manufacturing plants situated just outside such limits are usually owned and operated by residents of the city, and their labor is usually drawn from the population of the city, which also furnishes a ready market or distributing point for the products. They are therefore

a factor in the industrial prosperity or depression of the city, and their statistics should be included in a discussion of urban manufactures. As a rule, the establishments situated in a county which contains a city of any magnitude are identified with the city. Moreover, the adoption of the county as the unit of measure permits the tracing of the growth of manufactures in cities from 1860 to 1900, whereas if only establishments located within the corporate limits of the cities were to be considered, comparison of the statistics would necessarily be limited to the censuses from 1880 to 1900, inclusive, since the census of 1880 was the first at which the totals for cities were published separately.

Table xxv shows the increase in the manufactures and population of the 100 counties in which the principal cities were located, the increase for the United States, and for the United States exclusive of these counties, as well as the per cent of the totals for these counties to the totals for the United States at each census from 1860 to 1900, inclusive.

URBAN MANUFACTURES.

cclvii

TABLE XXV.—100 PRINCIPAL COUNTIES: COMPARATIVE SUMMARY, 1860 TO 1900.

	Year.	United States.	100 counties.	United States exclusive of 100 counties.	PER CENT OF INCREASE.			Per cent of 100 counties to total for United States.
					United States.	100 counties.	United States exclusive of 100 counties.	
Number of establishments.....	1860	512,276	222,601	289,615	44.1	12.7	83.6	43.5
	1870	355,405	197,629	157,776	40.0	102.8	1.0	55.6
	1880	258,852	97,670	166,182	0.7	19.8	28.5	38.5
	1890	252,148	81,595	170,613	79.6	70.1	84.4	32.3
	1900	140,433	47,930	92,503				34.1
Capital.....	1860	\$9,831,486,500	\$6,057,636,400	\$3,773,850,100	50.7	43.7	63.3	61.6
	1870	\$6,525,050,759	\$4,214,105,971	\$2,310,944,788	133.9	145.7	115.0	64.6

	1900	31,443,321	7,468,473	23,974,848				23.8

¹ Exclusive of Alaska and Hawaii, but including 85 Governmental establishments in Washington, D. C.

² Decrease.

The comparisons and percentages of increase shown in the above table should be considered in connection with the remarks relative to comparisons on page lxi. Making due allowance for changes in the form of the inquiry, for the more thorough enumeration at the later censuses, and for the inclusion of industries omitted at former censuses, the table may be taken as indicating the relative importance of urban and rural manufactures, respectively, at the different censuses. The percentage of urban manufactures increased until 1890, when the number of establishments formed 55.6 per cent, the wages 69.9 per cent, and the value of products 68.3 per cent of the totals for the United States. There has apparently been a wider distribution of manufactures since 1890, for in 1900 the number of establishments in these counties had decreased to 43.5 per cent, the wages to 63.3 per cent, and the value of products to 63 per cent of the total for the country. The proportion of the population of the 100 counties to the total for the United States has increased steadily during each decade since 1860. The total increase in the proportion of manufactures since 1860 in these counties has been in excess of the increase in the proportion of their population, but has not occurred with the same uniformity. The percentage of increase in the manufactures of the 100

counties has been greater, as a rule, than that of the United States or of the country outside of the 100 counties, except during the last decade, when it was less for all totals.

Although the increase in population is not subject to the varying factors which affect manufactures, nevertheless the percentage of increase in the population for the 100 counties and for the country outside of these counties has not been uniform, and this lack of uniformity has some bearing upon a similar lack in the percentages of increase for manufactures. But the fact that the proportion of the manufactures in the 100 counties has not increased with the same regularity as the proportion of population does not indicate that the statistics afford an unreliable basis for computing the proportion which the manufactures in the 100 counties bear to the total.

The totals show that there has been an increase at each census period in all of the items for each of the 3 divisions (the United States, the 100 counties, and the United States outside of the 100 counties), with the single exception of the number of establishments and the total wages reported for 1880 for the country outside of the 100 counties. This division showed for the decade an actual decrease of 8.5 per cent in the number of

establishments and 4.2 per cent in total wages. In the 100 counties the number of establishments increased 19.8 per cent, which more than counterbalanced the decrease outside of these counties and resulted in a slight gain for the entire country. The decrease in the total wages outside of the 100 counties was also more than overcome by the increase in the same item in the 100 counties.

The percentage of increase in each of the items shown for the United States outside of the 100 counties for the decade ending with 1880 was very much less than the percentage for the 100 counties, indicating a strong probability that the canvass of the general enumerators in the rural districts at that census was not as thorough as that of the special agents in the cities. On the other hand, the more thorough canvass of the rural districts at the census of 1900 resulted in securing reports from a larger number of the smaller establishments, such as cotton gins, and lumber and grist mills. This has caused a large increase, 83.6 per cent, in the number of establishments for the United States outside of the 100 counties, unaccompanied, however, by a corresponding

increase in the capital, wage-earners, wages, or value of products, since the manufacturing done by these additional establishments was comparatively small.

The large percentage of increase for values in 1870 is due in great part to the fact that the values reported for that census were in a currency that was at a great discount in gold. In order to make a true comparison possible, they should be reduced to a gold basis, in the manner described on page cxxxviii.

The decrease of 4.2 per cent in wages for the decade ending with 1880 in the United States outside of the 100 counties was followed by an increase of 120.1 per cent during the decade ending with 1890. While the percentages show exceptions to the general rule, the table may be accepted as indicating the general tendency toward concentration of manufactures in the principal producing centers, up to and including 1890; but since that date there has been a decrease in the proportion of manufactures in these centers.

The following diagram shows the relative growth in capital, wages, and products for the 100 counties from 1860 to 1900:

CAPITAL, WAGES AND PRODUCTS: FOR COUNTIES IN WHICH ONE HUNDRED PRINCIPAL CITIES ARE LOCATED, 1860 TO 1900.

The gross value of products reported for a large number of establishments may increase or decrease materially without affecting the average number of wage-earners on account of the varying proportions of the total costs which wages may form. It appears, however, from the above table that the decrease in the proportion of the value of the products in the 100 counties during the decade ending with 1900 has been accompanied by a decrease not only in the average number of wage-earners, but in all other particulars.

This decrease in the proportion of value of products is therefore in keeping with the tendency toward a wider distribution of manufacturing industries during the last decade.

The proportion which the number of wage-earners bears to the total population is possibly a better indication of the concentration of manufactures than is a similar comparison of the number of establishments, capital, or value of products. The number of wage-earners reported in the statistics of manufactures for

1900 is the average number continuously employed during the entire year. Although this average is not an ideal unit of comparison for determining the proportion of the employed to the total population, nevertheless the proportion does indicate to some extent the dependence of the different localities upon their manufactures. Table xxvi shows the proportion of the wage-earners to the total population in the United States as a whole, in the 100 counties, and in the United States, exclusive of the 100 counties, at each census from 1860 to 1900, inclusive.

TABLE XXVI.—100 principal counties: Percentage of wage-earners to population: 1860 to 1900.

YEAR.	PER CENT OF TOTAL POPULATION.		
	United States.	100 counties.	United States, exclusive of 100 counties.
1900.....	7.0	14.0	4.0
1890.....	6.8	15.5	3.4
1880.....	5.4	13.6	2.6
1870.....	5.3	11.8	3.1
1860.....	4.2	10.0	2.4

The percentage of the total population reported as wage-earners has, with two minor exceptions, increased steadily since 1860 in each of the 3 divisions shown in the above table, but the proportion in the 100 counties has been from three to five times as great as in the United States exclusive of these counties, and about twice as great as in the total for the United States.

In a country so vast as the United States, with such extensive and important rural districts, including agricultural and mining interests, the proportion which the industries of the principal centers bear to the totals for the entire country does not indicate adequately the importance of these centers compared with the different districts in which they are located. In order to make a more careful analysis of these centers it is therefore necessary to narrow the limits of the territory assigned to each.

Accepting the states east and west of the Mississippi River, respectively, as representing the different conditions to be considered, tables xxvii and xxviii show the totals for the manufactures of the 2 divisions and the ratio which the principal industrial counties in each group bore to the totals for that group from 1860 to 1900.

TABLE XXVII.—83 PRINCIPAL COUNTIES EAST OF THE MISSISSIPPI RIVER, COMPARED WITH STATES EAST OF THE MISSISSIPPI RIVER: 1860 TO 1900.

	1860	3,553	22,787,495	23,073	10,638,119	40,804,128	67,048,141	633,713
Per cent which 17 counties form of states west of the Mississippi River.	1900	22.9	42.5	42.5	43.6	42.5	48.5	13.5
	1890	36.8	51.3	50.9	54.9	53.8	54.7	14.0
	1880	27.6	51.0	56.5	61.0	54.4	55.6	13.0
	1870	26.8	50.8	40.5	50.0	54.1	55.8	15.6
	1860	19.3	32.6	23.8	23.1	52.8	40.9	14.0

In the preparation of these tables the cities of St. Paul and Minneapolis, Minn., were considered as lying west of the Mississippi River. Of the 100 counties in which the principal cities are located, 83 are in the states east and 17 in the states west of the Mississippi River.

Table xxvii indicates that the proportion of the population in the 83 principal counties in the Eastern states has been increasing and at each census period has been in excess of the proportion which the population of the 100 counties bore to the total population in the United States, as shown in table xxv. In the Western states, as shown by table xxviii, the proportion of the population in the 17 counties has decreased since 1870, when it was 15.6 per cent. The proportion of manufactures in the principal counties in both sections, however, increased, as a rule, in the Eastern states until 1890, when

65.9 per cent of the wage-earners, 72.2 per cent of the wages, and 70.6 per cent of the products were in the 83 counties; and in the Western states until about 1880, when 56.5 per cent of the wage-earners and 55.6 per cent of the products were in the 17 counties. During the last decade there appears to have been a tendency in both sections of the United States to a wider distribution of manufactures, which has reduced the proportion in the principal counties.

2. *100 Counties by Geographic Divisions.*—A more detailed analysis of the concentration in the 100 counties is presented in table xxix, which groups the counties according to geographic divisions and shows the number of counties considered in each division, the totals for manufactures and population, and the proportion which each item bears to the total for each geographic division, from 1860 to 1900, inclusive.

TABLE XXIX.—100 PRINCIPAL COUNTIES, BY GEOGRAPHIC DIVISIONS, WITH THEIR PER CENT TO THE TOTAL FOR EACH DIVISION: 1860 TO 1900.

GEOGRAPHIC DIVISIONS.	Year.	Number of counties.	NUMBER OF ESTABLISHMENTS.		CAPITAL.		WAGE-EARNERS, AVERAGE NUMBER.

	1860	2,381,710	8.1	16,165,429	55.8	22,234,267	30.6	89,871	20.2

The greatest concentration of population in the principal counties is shown for the New England states, while the greatest concentration of manufactures within the principal counties occurred in the Middle states, New England ranking second in this regard. The Central states in 1900 ranked third in concentration of manufactures; the Pacific states, fourth; the Western states, fifth (except in total wages, in which the Southern states led the Western states); and the Southern states, sixth. The greatest increase in the proportion of manufactures in the principal counties to the total for the division is shown for the Central and Western states.

During the forty years the proportion of population in the 100 principal counties increased from 23.8 per cent to 29.8 per cent. The greatest increase is shown for the New England states, where the proportion was 44.5 per cent in 1860 and 62.6 per cent in 1900. The smallest increase is shown for the Southern states, where the proportion was 7.6 per cent in 1860 and 7.7 in 1900. The increase in the proportion of the Central, Middle, and New England states has been constant, conforming to the increase for the United States. In all the other geographic divisions there has been an increase followed by a decrease. This increase and decrease is especially noticeable in the Pacific states,

where the proportion increased from 20.2 per cent in 1860 to 29.7 per cent in 1880, and decreased to 21.5 per cent in 1900.

The concentration of population has been somewhat in excess of the concentration of the value of products of manufactures. The proportion of the products in the 100 counties increased from 58.7 per cent in 1860 to 63 per cent in 1900, as compared with an increase from 23.8 per cent to 29.8 per cent in the proportion of population. In the New England states, where the greatest increase is shown in the concentration of population, the proportion of the value of products of manufactures increased from 65.4 per cent to 73.8. In the Southern states, where the proportion of population has remained practically stationary, the proportion of the value of products decreased from 31.2 per cent to 28.2 per cent. In the Western states, where the proportion of the population increased from 4.9 per cent to 7.5 per cent, the proportion of the value of products increased from 11.2 per cent to 31.1 per cent.

The relation of the average number of wage-earners to population is possibly more direct than that between value of products and population. In the total for the United States the proportion of the average number of wage-earners engaged in the manufactures of the 100

STATISTICS OF MANUFACTURES.

counties increased from 56.8 to 59.7, as compared with an increase from 23.8 per cent to 29.8 per cent in the proportion of population. In the New England states, the proportion of the average number of wage-earners increased from 63.7 per cent to 71.4 per cent as compared with an increase in population from 44.5 per cent to 62.6 per cent. In the Middle states, it increased from 70.1 per cent to 73 per cent and the population from 46.4 per cent to 59.9 per cent. In the Southern states, where the proportion of the population remained practically stationary, the proportion of wage-earners decreased from 26 per cent to 23 per cent, which is in conformity with the similar decrease of the proportion of the value of products. The greatest increase in the proportion of wage-earners in the 100 principal counties is shown for the Pacific states, where the percentage increased from 4.7 per cent to 38.1 per cent. This net increase in the proportion in the Pacific states

has been in spite of a decrease since 1880, when the proportion stood at 65.6 per cent. The totals for the United States show a great uniformity of increase and decrease. The absence of a similar uniformity in some of the geographic divisions may be accounted for by local conditions and does not necessarily prove that the statistics are unreliable. The table as a whole indicates that there has been an increasing concentration of population in the 100 principal counties since 1860, and that this has been accompanied by a like concentration of industries according to value of products except during the last decade. This concentration in industry appears to have reached its limit in 1890.

3. *States Showing Greatest Concentration.*—Table xxx presents the statistics for the 5 states in which the concentration of manufactures in the selected counties is carried to the highest point, excepting Delaware and Rhode Island.

The two states which show the greatest concentration—Delaware and Rhode Island—are not included in the above table, as their urban manufactures are peculiar. The city of Wilmington includes practically all the manufactures of Delaware, and the town and city formation of government in Rhode Island has resulted in including practically the entire area of that state within the districts which were, for census purposes, considered as urban.

The greatest concentration in the population appears for Massachusetts, where the population of the 6 counties in which the principal cities were located contained 82.3 per cent of the population of the state in 1900. The greatest increase in concentration of the population during the 40 years is shown for Illinois, where the 4 counties in which the principal cities are located contained 14.9 per cent of the population in 1860 and 42.8 per cent in 1900. Notwithstanding this large increase the 4 counties contained a smaller percentage of the population of the state in 1900 than did the selected counties of any of the other states shown. There has been a considerable increase in the percentage of the population in the principal counties of each of the 5 states.

The greatest concentration in manufactures appears in the case of Massachusetts, where the establishments in the 6 principal counties formed 82.9 per cent, their wages 84.9 per cent, and the value of their products 85.9 per cent of the total for the state in 1900. The greatest increase in concentration is shown for Illinois, where the percentage of establishments in the principal counties increased from 20.1 per cent in 1860 to 57.4 per cent in 1900; the proportion of wages from 38.6 to 74.5 per cent, and the value of products from 39.8 to 77.2 per cent.

The statistics shown in this table indicate, first, that the concentration of industries in the principal counties during the past forty years has been in states where manufactures have become well developed, such as Massachusetts, New York, and Connecticut; second, that the greatest increase in concentration has been in the Central states, of which Illinois is a representative, where the increase in population has been greatest; third, that the concentration of population in the industrial centers has been constantly increasing in a somewhat greater ratio than the concentration of manufactures; fourth, that the concentration of manufactures has decreased during the last decade.

IV.

DEVELOPMENT OF LARGE CITIES.

In a number of instances large cities have extended their corporate limits during the period between the censuses, in such a way as to embrace additional territory including adjoining cities and towns. In such cases, the statistics for the censuses preceding and following such extension, comprehend different areas and are not comparable. The selection of a given district including all territory immediately surrounding such large cities—not only that which has already been added but that which may be included in the corporate limits at subsequent censuses—enables comparisons to be made showing the actual development of the district irrespective of the city limits. The cities of New York, N. Y.; Philadelphia, Pa.; Chicago, Ill.; and

Boston, Mass., have been selected as representative of these conditions.

1. *New York City*.—A notable instance of the extension of the corporate limits of a city, and also of the close proximity of other cities and towns in which the industrial interests are closely connected, is shown for New York.

The inclusion of the totals for the counties of Kings, New York, Queens, and Richmond, in New York state, and of Bergen, Essex, Hudson, Passaic, and Union counties, in New Jersey, as a district immediately surrounding New York, makes it possible to give the actual increase in the manufactures, irrespective of the extension of the corporate limits of the city, and results in showing the importance of the industrial center. This is done in table xxxi, which gives the statistics for the New York district at each census from 1860 to 1900, inclusive, with the percentages of increase.

TABLE XXXI.—NEW YORK AND ADJOINING COUNTIES: COMPARATIVE SUMMARY, 1860 TO 1900, WITH PER CENT OF INCREASE FOR EACH DECADE.

	DATE OF CENSUS.					PER CENT OF INCREASE.			
	1900	1890	1880	1870	1860	1890 to 1900.	1880 to 1890.	1870 to 1880.	1860 to 1870.

Capital.....	\$1,286,664,417	\$794,350,833	\$318,522,965	\$197,787,275	\$99,527,877	62.0	149.4	61.0	98.7
Wage-earners, average number.....	626,086	528,715	363,280	193,256	140,774	18.4	45.6	88.0	37.3
Total wages.....	\$322,323,957	\$293,681,827	\$154,528,319	\$95,152,658	\$48,552,257	9.8	90.1	62.4	118.5
Cost of materials used.....	\$959,782,066	\$675,635,685	\$551,051,571	\$290,628,653	\$137,284,875	42.1	22.6	89.6	111.7
Value of products, including custom work and re- pairing.....	\$1,798,020,115	\$1,339,001,356	\$852,451,380	\$511,151,711	\$246,385,929	34.3	57.1	66.8	107.5
Total population.....	4,515,299	3,289,563	2,474,449	1,890,348	1,415,679	37.3	32.9	33.0	31.4

The largest actual increase and the highest percentage of increase in the population of the district occurred during the decade ending with 1900. Measured by value of products, the largest actual increase in manufactures was during the decade ending with 1890. The largest percentage of increase is found in the decade ending with 1870, but the values reported for 1870 were in a currency that was at a great discount in gold.

New York city was founded as a commercial venture by a trading company, and from the very start has been a business community, the greater part of its development having been due to its unrivaled advantages for exchange.¹ But it appears, according to the statistics of population, that of 4,106,370 persons in the total population of the 6 large cities in the district, 681,036, or 16.6 per cent, were engaged in manufacture or mechanical pursuits, while only 549,207, or 15.8 per cent, were engaged in trade and transportation, and that therefore manufactures rather than commerce must be accepted as the important factor in the development of the district.

The statistics of wage-earners; however, in these two groups do not afford a basis for an accurate estimate of the relative importance of manufactures and commerce in the life of a city. A city's commerce is itself, in considerable measure, the direct consequence of its manufactures. The employment of many of the persons reported for transportation depends upon the manufactures of the city.

2. *Philadelphia*.—Philadelphia city is co-extensive with the county, and was so considered in presenting the statistics for the 100 principal counties. While there has been no extension of the corporate limits of the city during recent years, nevertheless the industrial development of the adjoining territory and cities has been to some extent identified with that of Philadelphia. Considering Delaware, Montgomery, and Philadelphia counties, Pennsylvania, and Camden and Mercer counties, New Jersey, as representing an industrial district, table xxxii gives the statistics of manufactures for the district at each census from 1860 to 1900, inclusive, with the percentages of increase.

¹ Historic towns, New York, by Theodore Roosevelt.

URBAN MANUFACTURES.

cclxv

TABLE XXXII.—PHILADELPHIA AND ADJOINING COUNTIES: COMPARATIVE SUMMARY, 1860 TO 1900, WITH PER CENT OF INCREASE FOR EACH DECADE.

Total population.....	1,730,462	1,412,602	1,120,768	887,616	738,493	22.5	26.0	26.3	20.2

¹ Decrease.

² Less than one-tenth of 1 per cent.

The greatest absolute increase in the population of the district occurred during the decade ending with 1900, while the largest percentage of increase was for that ending with 1880. The largest absolute increase in gross value of products was during the ten years ending in 1890, and the highest percentage of increase in the decade ending in 1870. From the table it appears that there has been a constant increase in manufactures. This increase, however, has been at a varying ratio. During the decade ending with 1870 the gross value of the products was represented as increasing 135 per cent; during that ending with 1880 it increased only 6.3 per cent; this relatively slight increase was followed by a large percentage of increase, 74.6, during the next decade; and this again by a comparatively small increase, only 7.4 per cent, for the decade ending with 1900. The percentage of increase in the population also de-

creased from 26.3 per cent during the decade ending with 1880, to 26 in the decade ending with 1890, and still further to 22.5 per cent for the last decade.

Of the total population (1,476,927) of the 4 large cities included in the district, Philadelphia and Chester, Pa., and Camden and Trenton, N. J., 296,828, or 20.1 per cent, were reported at the census of 1900 as engaged in manufactures, while only 170,196, or 11.5 per cent, were engaged in trade and transportation.

3. *Chicago*.—The rapid growth of Chicago has resulted in the extension of the corporate limits of the city, and as the adjoining counties have been identified with its development, table XXXIII, which includes the totals of Cook, Dupage, Kane, and Will counties, Illinois, and Lake county, Indiana, may be accepted as showing the growth of the manufacturing industries of the district.

TABLE XXXIII.—CHICAGO AND ADJOINING COUNTIES: COMPARATIVE SUMMARY, 1860 TO 1900, WITH PER CENT OF INCREASE FOR EACH DECADE.

	DATE OF CENSUS.					PER CENT OF INCREASE.			
	1900	1890	1880	1870	1860	1890 to 1900.	1880 to 1890.	1870 to 1880.	1860 to 1870.
Number of establishments.....	21,658	11,021	4,510	1,900	706	96.5	144.4	126.6	181.9
Capital.....	\$607,465,282	\$392,162,933	\$80,680,590	\$45,608,633	\$6,739,533	54.9	336.1	76.9	576.7
Wage-earners, average number.....	295,272	206,615	88,475	36,177	6,621	42.9	133.5	144.6	446.4
Total wages.....	\$147,556,093	\$112,428,278	\$38,360,706	\$14,991,698	\$2,325,989	81.2	193.0	155.9	544.6
Cost of materials used.....	\$608,894,681	\$453,774,480	\$198,022,563	\$64,750,982	\$9,099,376	33.1	120.2	205.8	611.6
Value of products, including custom work and repairing.....	\$1,004,414,062	\$732,647,701	\$277,298,074	\$100,748,321	\$15,463,505	37.1	164.2	175.2	551.5
Total population.....	2,058,879	1,865,427	740,137	461,004	228,183	50.7	84.5	60.5	102.7

The substantial and rapid growth of the manufactures in this district is apparent from these statistics. Computations based upon the general statistics, not given in this table, show that the percentages of increase during the decade from 1860 to 1870 were in excess of those for any other district in the United States. While the increase during the subsequent decades has not been so rapid, it has nevertheless been in advance of the increase for the same totals in the Central states. During the last decade the population of the Central states increased 19.1 per cent, the number of manufacturing

establishments 47.2 per cent, and the value of products, 35.8 per cent; while the corresponding items in the Chicago district show increases of 50.7, 96.5, and 37.1 per cent, respectively.

The situation of Chicago enables it to command one of the most important stretches of inland water navigation in the world, and commerce was therefore naturally the leading feature of its early development. Its largest commercial transactions are in grain and other agricultural products.

Manufactures have also been an important element

in the development of the district. This is indicated by the fact that of the total population, 1,727,928, of the cities of the district, Chicago and Joliet in 1900, 255,293, or 14.8 per cent, were persons engaged in manufacturing and mechanical pursuits as compared with 234,074, or 13.5 per cent, engaged in trade and transportation.

4. *Boston*.—The industrial development of the coun-

ties of Essex, Middlesex, and Suffolk has been closely identified with that of Boston, and these counties may be accepted as representing an industrial district. Table xxxiv is a comparative summary showing the statistics of manufactures for this district, as reported at each census from 1860 to 1900, inclusive, with the percentages of increase.

TABLE XXXIV.—BOSTON AND ADJOINING COUNTIES: COMPARATIVE SUMMARY, 1860 TO 1900, WITH PER CENT OF INCREASE FOR EACH DECADE.

¹ Decrease

The greatest percentage of increase for the district, except for the item of capital in 1890, occurred during the decade ending with 1870, when the population and the value of products of manufactures increased 29.8 and 161 per cent, respectively. Since 1860 the rate of increase has been constantly diminishing, the only exception being for the decade ending with 1890. The smallest percentage of increase is shown for the last decade. Indeed, the statistics for the manufactures of the city of Boston, given in the report on the manufactures of Massachusetts, in Part II, show that there was an actual decrease in the industries of the city itself during the period from 1890 to 1900. The percentage of decrease in number of establishments was 8.8; in number of wage-earners, 8.1; and in value of products, 2.3. From the above table it appears that the manufactures of the Boston district, including the territory which is closely identified with the industrial development of the city, have increased during the decade in all particulars except number of establishments, which decreased 3.4 per cent; but, as previously explained, the decrease in number of establishments does not indicate an actual decrease in the manufacturing industries of a community.

Commerce was the chief factor in the early development of the district, but the present comparative importance of manufactures and trade and transportation is roughly indicated by the fact that of the total population—852,962—of the large cities of the district, 137,367 persons, or 16.1 per cent, were engaged in manufactures, while 122,755, or 14.4 per cent, were engaged in trade and transportation.

V.

URBAN MANUFACTURES, BY STATES.

1. *Increases and Decreases in Cities*.—While the totals for the manufactures of the cities show large increases, the increase has not been uniform, and in a number of instances has given place to an actual decrease. In some cities, too, while the total for all industries shows a net increase, a number of the individual industries have decreased.

In some cases the decrease is due to an actual falling off caused by business depression, previous overproduction, or some one of the various other conditions which affect all industries wherever situated. In others it is due to the removal of manufacturing plants to the suburbs, outside the corporate limits of the city, or to sections of the United States where raw material is more readily obtained and the products can be more advantageously disposed of; where labor is more plentiful and power and land are cheaper; where subsidies are given or immunity from taxation offered; or where advantage can be taken of other economies of production.

In some cases the decrease is only apparent, being due to a faulty canvass at prior censuses. A striking instance of such an error appears in the statistics for the city of Mobile, Alabama. There were 17 sawmills reported for this city at the census of 1890, with a capital of \$1,018,540, with 1,158 wage-earners, \$345,210 paid in wages, and \$1,589,499 in value of products; while in 1900 only 4 establishments appeared, with a capital of \$342,650, with 321 wage-earners, \$113,400

paid in wages, and \$566,800 in value of products. A close study of the case has disclosed the fact that 7 of the mills which were credited to the city in 1890, with a capital of \$430,285, wage-earners numbering 293, and paying \$102,847 in wages, and with products valued at \$402,023, were located outside the corporate limits, although their post-office address was Mobile, most of them, if not all, having offices in the city. It is often difficult to determine, without a special investigation, the exact location of plants situated near the boundary line of cities. The inclination is to give the municipality credit for such plants, on the theory that they form a part of the industrial city.

Mistakes of this kind were due largely to the fact that the schedule in 1890 called only for the name, street and number, and post-office address of the establishment. The schedule for the census of 1900 required that not only the post-office address should be given, but also the exact location of the factory or shop. This has enabled the office to make a more exact division of the reports according to the geographical location of the plants, and has resulted in a more accurate presentation of the statistics for the establishments which are located within the corporate limits of the respective cities. At the census of 1890 it was found impossible to locate exactly the operations of establishments engaged in the manufacture of timber products classified as "timber products not manufactured at mill," and the industry was therefore "credited to the place where the office of the establishment was located." The fact that a different practice was adopted in 1900 has had some effect on the totals for the different cities as presented at the two censuses.

The shifting of establishments from one section of the country to another in the endeavor to find the locality in which the manufacture can be carried on to the best advantage is becoming more prevalent with the increased competition following the rapid extension of manufactures. The consolidation of a number of independent plants under one management and the consequent abandonment of the plants that can not be worked to advantage is another phase of this general readjustment. This has not affected the industrial growth of the United States as a whole, but has perceptibly advanced or retarded the industries of localities. In addition to these economic causes, the increase or decrease in certain cities may be due to changes in the kinds of industries enumerated at different censuses and to the more thorough canvass in some cities than in others, while the apparent growth or decline of certain industries may be caused by changes in the methods of classifying the reports.

Under these conditions the increase in the grand total for cities should not be accepted as a true indication of the conditions prevailing in each city; a more extended

analysis is necessary in order to select the cities which have contributed to or retarded the general advance.

The importance of the manufactures of urban districts is now universally acknowledged, and the general information possessed by the citizens of the different cities in regard to their industries is so complete that statistics which are apparently contrary to such general knowledge should be carefully presented and fully explained. With this end in view the statistics for each city where the totals for all industries show a decrease during the past decade in any of the principal particulars will be analyzed.

The statistics of the 165 cities for which separate totals were given at the census of 1890 must form the basis for all comparisons designed to show the increase or decrease in urban manufactures, in so far as such manufactures are represented by the establishments included within the corporate limits of the cities considered. The statistics for 100 of these cities were shown separately at the census of 1880. The statistics for each city are shown in detail in Part II of this report, and reference should be made to that volume for information concerning the different industries.

Of the 165 cities for which the statistics were published separately at the census of 1890, there are 90 in which there was a decrease during the last decade in one or more of the items shown. A decrease appears in the number of establishments in 49 cities, in the capital invested in 23, in the average number of wage-earners employed during the year in 35, in the total wages paid in 49, in the miscellaneous expenses in 30, in the cost of materials in 35, and in the total value of products in 31 cities.

The increase or decrease in the total for all industries in any city is the net result of the increases and decreases in its different industries. In a few cases the entire decrease in all the items shown for a city can be traced to the changes that have occurred in a single industry. On the other hand, an important industry or a number of industries may show a decrease, and yet these decreases may be more than counterbalanced by increases in other industries, with the result that the total for all industries will indicate a general advance. In some cities, where one or two establishments represent a large proportion of the total for the city, the removal of one of these large plants, combined with the changes shown for other industries, has resulted in a large decrease, even though a number of the industries of the city have increased. In order to ascertain the actual conditions it would therefore be necessary to compare and analyze the figures for each industry; but as an analysis of that character would be more extended than the importance of the subject seems to warrant, this discussion is confined primarily to the city totals, only incidental reference being made to the industries.

2. *Establishments.*—The fact that a city shows a greater or less number of establishments than at a prior census is no indication of the increase or decrease in its manufactures. The term establishment may include one or a number of manufacturing plants controlled by the same individual, company, or corporation, and it is applied indiscriminately to large factories and small shops. Therefore in a city showing an increase in the number of establishments there may be a decrease in the capital invested, in number of wage-earners, and in value of products on account of the removal of one or two large establishments during the decade and a more perfect enumeration of the small shops at the later census.

For instance, the totals for the city of Minneapolis, Minn., for the census of 1890, show 2,723 establishments, with products valued at \$82,922,974; and in 1900, 2,368 establishments, with products valued at \$110,943,043, an apparent decrease of 355 in number of establishments and an increase of \$28,020,069 in value of products. Eliminating the hand trades reported for both censuses, there remain 940 establishments with products of \$63,924,996 for 1890, as compared with 1,087 establishments, with products of \$97,053,501 for 1900, an increase of 147 in number of establishments and of \$33,128,505 in value of products.

In the city of Fort Worth, Tex., there were 316 establishments reported for 1890, with products of \$6,826,083, as compared with 209 establishments, with products of \$5,332,804, in 1900, a decrease of 107 in the number of establishments and of \$1,493,279 in value of products. Deducting the hand trades from the totals for both censuses, however, there remain 95 establishments for 1890, with products of \$3,883,494, and 92 establishments in 1900, with products of \$4,546,316, a decrease of 3 in the number of establishments, but an actual increase of \$662,822 in value of products.

To repeat, then, it is clear that the number of establishments reported for a city is no indication of the condition of its manufactures, and the same is true of the items "miscellaneous expenses" and "cost of materials used." The cost of materials is, to some extent, governed by conditions distinct from those causing an increase or decrease in the value of products. The controlling industries in a city in 1890 may have been of a character in which the material was purchased in a partially manufactured form, while in 1900 it was purchased raw. Such a manufacture is that of paper, in which in 1890 certain establishments purchased the wood pulp they used, while in 1900 they purchased the material in the raw state of "logs" and the ground pulp. Under these conditions there would be a larger expenditure for materials in 1890 than in 1900, a decrease being shown for the decade which would be accompanied by a corresponding increase in total wages; the cost having been shifted from the materials to the labor account.

Since an increase in other items may be accompanied by a decrease in miscellaneous expenses and also in cost of materials, the prosperity or depression in manufactures is more accurately determined by capital invested, number of wage-earners, amount paid in wages, and value of products. There are 60 cities in which there appears to have been a decrease in one or more of these particulars. The detailed statistics for each city as reported at the census of 1900 are given in the tables for each state in the Report on Manufactures, Part II, which also contains comparative tables showing the totals for each city as reported at the censuses of 1890 and 1900. Reference should therefore be made to that volume for detailed statistics for each city.

3. *Items Presented.*—In the following discussion of the statistics of urban manufactures for each state, summary tables are presented showing the percentage of increase in the totals for all industries in the state; in the totals for the cities in the state which were published separately at the censuses of 1880, 1890, and 1900; the percentages which the totals for the cities at each census formed of the totals for the respective states; and also the percentages which the districts, exclusive of the cities, formed of the totals for the state in 1900. The percentages of increase for the state are presented in connection with those for the cities in order to show the relative increase in urban and rural manufactures.

Special attention is given to cities in which a decrease is shown in capital, wage-earners, wages, or value of products, and the statistics for the industries reporting large decreases are presented separately. In preparing these tables the statistics for such industries as "dentistry, mechanical;" "coffins, burial cases, trimming and finishing;" "hay and straw baling," and "electric light and power," which were enumerated at the census of 1890, but which have been omitted from the reports of the present census, will be excluded from the totals for the census of 1890 so as to make possible a more perfect comparison of the totals for the two censuses. The group of hand trades is shown separately in each table, but in preparing the comparative totals for this group, it has been found necessary in some instances to omit the figures for a few establishments which were included at the census of 1890 in the group of "all other industries." The amounts thus omitted, however, are so small that the totals are not seriously affected. In some cases the total for the group of "hand trades," or "all other industries," produces a net increase for the city, owing to the fact that the increases in the separate industries included have more than offset the decreases.

The states and territories are considered in alphabetical order. In each case a table is first presented showing the percentages of increase for each, whether or not the state contains cities the statistics of which are shown separately.

ALABAMA.

TABLE XXXV.—PERCENTAGES OF INCREASE AND PERCENTAGES OF MANUFACTURES AND POPULATION IN CITIES: 1880 TO 1900.

	PER CENT OF INCREASE.					PER CENT OF TOTAL FOR THE STATE.

¹ Decrease.² Not reported in 1880.

4. *Alabama.*—The increase in manufactures for the entire state during the last decade in amount paid in wages has been 40.1 per cent, and in value of products 57.6 per cent, as compared with an increase in the 3 principal cities of 39.4 and 56.6 per cent, respectively. The ratio of the products of the 3 principal cities to the totals for the state has remained practically the same at the last two censuses, and the same is true of the amount paid in wages. The increase in the 3 cities has been constant, and in one of them, Birmingham, has been in excess of the increase in the state. Mobile is the only city for which the statistics of manufactures

were shown separately at the census of 1880, and percentages of increase are therefore given for its manufactures as reported at the last three censuses; but, for reasons already stated, these percentages should not be accepted as indicating the actual increase, nor should the decrease in the number of establishments shown for the city during the last decade be regarded as indicating an actual decrease in its manufactures. The great increase in the manufactures of Birmingham has been the principal factor in preserving the proportion between the totals for the 3 principal cities and those for the state.

ARKANSAS.

¹ Not reported in 1880.

5. *Arkansas.*—The rural interests of the state predominate, as is indicated by the fact that the 5 cities and towns reported separately in 1900 contained only 5.3 per cent of the population.

Little Rock is the only city for which the statistics were published separately at the census of 1890. The percentage of increase in the number of its establishments was 37.9 per cent; in the total wages paid, 117.9 per cent; and in the value of its products, 51.3 per cent. In the state the establishments increased 131.3 per cent; the wages paid, 86.8 per cent; and the value of the products, 99.5 per cent.

The rapid increase of the lumber and timber industry, which is confined largely to the rural districts, has tended to reduce the proportion of manufactures in cities. The number of establishments shown for the rural districts was largely increased by reports for cotton ginneries (explained elsewhere), but as the value of products for this industry was comparatively small, being merely the toll received for ginning, the amount of products for the rural districts was not increased proportionately to the increase in number of establishments, the percentage of establishments in the districts outside of the cities being 88.9, as compared with 78.6 for the value of products. With the exception of the lumber industry and cotton ginning, the manufactures of the state were largely limited to its 5 principal cities.

¹ Decrease.² Not reported in 1880.

6. *California.*—The value of products of manufactures in the state has been uniformly in excess of that of products of agriculture. The value of manufactures in the rural districts was \$104,873,972, or 34.6 per cent of the total for the state.

The value of products of the 4 principal cities in 1890 formed 77.3 per cent of the total value of products for the state. This percentage decreased to 57.7 in 1900, owing largely to the decreases which have occurred in the cities of Oakland, San Francisco, and Sacramento:

The wages paid in the manufactures of the 16 principal cities which represent the urban districts were for 1900 \$35,006,539, or 73.8 per cent; the value of their products amounted to \$198,000,789, or 65.4 per cent of the total for the state, and their aggregate population was 647,834, or 43.7 per cent of the total.

Table xxxviii shows the principal decreases which have occurred in the industries of Oakland during the last decade.

TABLE XXXVIII.—DECREASES IN OAKLAND, CAL.

INDUSTRIES.	CAPITAL.				WAGES.			
	1900	1890	Increase.	Decrease.	1900	1890	Increase.	Decrease.
All industries ¹	\$6,864,651	\$6,557,268	\$192,617	\$2,129,598	\$2,561,298	\$431,700
Flouring and grist mill products.....	75,898	210,400	134,502	23,360	19,930	\$3,430
Lumber, planing mill products, including sash, doors, and blinds.....	560,768	510,936	\$49,832	194,735	330,330	135,595
Masonry, brick and stone.....	5,090	138,400	133,310	2,250	188,432	186,182
Sausage.....	14,750	14,750	7,089	7,089
Leather, tanned, curried, and finished.....	119,118	119,118	20,028	20,028
Hand trades, not separately shown.....	713,550	457,558	255,992	609,705	464,810	144,895
All other industries.....	5,009,345	5,106,106	96,761	1,299,648	1,530,679	231,131

¹ The totals for 1890 do not include the statistics for 5 establishments reported for "coffins and burial cases, trimming and finishing."

An increase is shown for some of the industries included in the above table, but they do not equal the decrease in others; so there is a total increase in capital of \$305,824, and a total decrease of \$498,441, making the net decrease \$192,617. There is also shown a net decrease in wages of \$431,700.

The decrease in capital is largely explained by the removal from the city or by the discontinuance of 3 establishments reported in 1890 as engaged in the tanning and currying of leather, and by the reduction in the capital reported as invested in flour mills.

The largest decrease in wages, \$186,182, is shown for "masonry, brick and stone," a building industry in

which the decrease may have been due to temporary conditions of building operations which do not necessarily affect many manufacturing industries. The planing mills, however, depend largely upon the building operations to dispose of their products, and this industry also shows a decrease in the total wages paid during the year. The decrease of \$231,131 shown for "all other industries" is scattered through a number of industries, and no satisfactory explanation can be made; but these decreases should be considered in connection with totals reported for San Francisco, with which the city is closely connected industrially.

URBAN MANUFACTURES.

cclxxi

The decreases in the totals for San Francisco are limited to wages and products. Table xxxix shows the principal decreases which have occurred in the industries of this city during the last decade.

Hand trades.....	3,252,765	4,451,821	1,199,056	12,969,059	15,831,892	2,842,833
All other industries.....	15,348,621	13,756,741	\$1,591,880	97,121,838	75,449,307	\$21,672,531

¹The totals for 1890 do not include the statistics for 117 establishments reported for "dentistry, mechanical."

The net decrease in wages reported for the city amounted to \$2,509,368, and in products to \$2,157,120. As shown in the above table, the decreases are well distributed among the various industries of the city, and while in some instances they may be explained by changes in classification and in methods of enumeration, especially in the hand trades, they nevertheless indicate that the industrial conditions of the city were unsettled during the decade or that there was a temporary depression during the census year 1900.

By far the largest decrease in the value of products, \$11,496,669, is shown for "sugar and molasses refining." The sugar refined in San Francisco comes principally from the Hawaiian Islands, and while not all the sugar entered at the port is necessarily refined there, the extent of importations indicates the general conditions of the industry in that city. During the year ending June 30, 1900, there were entered in the San Francisco district 262,237,315 pounds of cane sugar from Hawaii, valued at \$10,809,058, and 10,198,894 pounds of other sugar, valued at \$253,919. In 1899 the corresponding quantities were 236,491,481 pounds of Hawaiian sugar, valued at \$8,831,172, and about the same quantity of other sugar as in 1900. In 1890, 224,457,011 pounds, valued at \$11,549,828, were entered. That is, the quantity of Hawaiian sugar entered

in 1900 was 37,780,340 pounds more than ten years before, but the import value was \$740,770 less. The conclusion is warranted that the decrease in the value of products of San Francisco sugar refining was partly due to the decline in the price of sugar. Without doubt it was also due in part to the establishment of refineries at other points in California. In 1890 the 3 refineries in San Francisco were the only ones reported for the state, while in 1900, in addition to the 3 in San Francisco, there was 1 in Los Angeles, 1 in Orange county, and 1 in Contra Costa county, and the products of these outside refineries were valued at \$4,732,817.

A large decrease was also reported in both wages and products for "furnishing goods, men's." The largest establishments in this industry in 1890 were engaged in the manufacture of men's overalls, shirts, and other garments in connection with a mercantile business. In such cases it is the exception for establishments to keep separate accounts of the two branches of business, and the value of the manufactured product is, therefore, necessarily estimated, or else the total value of the year's business for the entire establishment is included in the report. The lack of uniformity in this respect should be considered in comparing the totals for this industry as reported at the two censuses.

STATISTICS OF MANUFACTURES.

COLORADO.

TABLE XL.—PERCENTAGES OF INCREASE AND PERCENTAGES OF MANUFACTURES AND POPULATION IN CITIES:
1880 TO 1900.

	PER CENT OF INCREASE.					PER CENT OF TOTAL FOR THE STATE.

¹ Not reported in 1880.

7. *Colorado*.—The products of manufactures reported at the census of 1900 were valued at \$102,830,137. The manufacturing industries depend largely upon mining for raw materials, and also upon the demand of the mining population for a market for finished products. As shown by the table, the manufactures were largely concentrated in the principal cities and towns. Of the total value of products reported for manufactures, 43.4 per cent—\$44,625,305—appears for the smelting and refining of lead and copper.

The percentage of increase for the city of Denver during the last decade has been somewhat less than the percentage of increase in the state as a whole, or in the other principal cities. Moreover, the percentage which

the manufactures of the city formed of those of the state has perceptibly decreased during the ten years from 1890 to 1900. In the former year the value of the products of Denver constituted 68.8 per cent of the products of the state, while in 1900 it was 40.2 per cent. It appears from the table that the 8 principal cities at the census of 1900 contained 65.1 per cent of Colorado's manufacturing establishments, paid 79.5 per cent of the wages, and produced 81.4 per cent of the total value of products. The table indicates, therefore, that the establishment of new manufacturing enterprises has been confined largely to the cities, and that diffusion of manufactures among the rural districts is not as yet a feature of the development of the state.

CONNECTICUT.

TABLE XLI.—PERCENTAGES OF INCREASE AND PERCENTAGES OF MANUFACTURES AND POPULATION IN CITIES:
1880 TO 1900.

	PER CENT OF INCREASE.					PER CENT OF TOTAL FOR THE STATE.

¹ Not reported in 1880.

8. *Connecticut*.—Table xli shows that the increases in the state and its principal cities have been uniform during the two decades, but that the percentages of increase in the cities, as a rule, have exceeded those for the state. The proportion of the city manufactures to the total for the state has also increased. In 1880 the products reported for the 3 principal cities formed 24.7 per cent of the total products of the state, and 31.1 per cent in 1900. The 5 principal cities shown separately in 1890 reported 41.3 per cent of the total value of products in

that year, and 44.5 in 1900. The 61 principal cities and towns shown separately in 1900 paid 92.2 per cent of the wages and produced 92.4 per cent of the total value of products of the state. All the cities show substantial increases, with the exception of Meriden, for which there is a net decrease of \$61,744 in wages. This decrease is apparently due to temporary local conditions, being confined largely to the hand and building trades, and does not signify a decrease in the manufactures of the city.

URBAN MANUFACTURES.

¹ Not reported in 1880.

9. *Delaware.*—Table XLII indicates that there was a large increase in the manufactures of the state, and also that it was largely confined to the city of Wilmington. The increase in the city of Wilmington has been in excess of the increase in the state exclusive of the city, indicating a constant tendency to concentration at that

point. The percentages in the two cities, Wilmington and Newcastle, which were reported separately in 1900, were largely in excess of those for the state exclusive of the two cities, although their population formed only 43.2 per cent of the population of the state.

FLORIDA.

TABLE XLIII.—Percentages of increase and percentages of manufactures and population in cities: 1880 to 1900.

	PER CENT OF INCREASE.		PER CENT OF TOTAL FOR THE STATE.	
	The state.		3 cities, towns, etc.	State, ex- clusive of 3 cities.

¹ Not reported in 1880.

10. *Florida.*—Table XLIII indicates that the percentages of increase during the last decade have, as a rule, been considerably less than during the decade ending with 1890, the percentages of increase for wages and products for the decade ending with 1900 being 80.5 and 102, respectively, as compared with 365.7 and 228.6 for the decade ending with 1890. The increase has been confined largely to the industries in the rural districts, such as "lumber and timber products," and "tar and turpentine," and this has tended to reduce the proportion of urban to total manufactures. It appears, however, that the wages and products of manufactures of the 3 principal cities of the state in 1900 amounted to 35.8 and 35.9 per cent, respectively, of the totals for the state.

GEORGIA.

¹ Decrease.² Not reported in 1880.

11. *Georgia*.—During the decade ending in 1900 the percentages of increase in the wages and products of manufactures for the entire state were somewhat in excess of those for the principal cities. The population of the cities, however, has increased at a greater ratio than that of the state. Although in the 3 cities there have been steady increases in the products, the percentage of increase for the last decade has been considerably less than that for the earlier decades.

The wages and value of products of the 3 principal cities, published separately at the census of 1880, formed respectively 33.9 per cent, 40.7 per cent, and 30 per cent of the wages, and 31.3 per cent, 41.6 per cent, and 31.1 per cent of the products of the entire state at the different census periods of 1880, 1890, and 1900. The 4 cities published separately in 1890 show substantial increases.

There are slight decreases in number of establishments, explained by the inclusion or omission of the hand trades. Atlanta and Macon also show decreases of \$102,296 and \$9,604, respectively, in the amount of wages paid, which appear to have been due in part to the omission of the hand trades and also to local conditions and to lack of uniformity in securing the schedules at the two censuses. They do not indicate a decrease in the manufacturing industries of the cities.

Table XLIV indicates that the manufactures of the state are quite evenly divided between urban and rural districts. The 17 cities published separately in 1900 controlled 50.5 per cent of the wages and 53.1 per cent of the value of the products, as compared with 49.5 and 46.9 per cent for the two items, respectively, in the state exclusive of the cities.

¹ Not reported in 1880.

12. *Illinois*.—Of the total population, 2,459,638, or 51 per cent, resided in the 70 principal cities and towns. The wages paid in these places were \$177,811,025, or 92.8 per cent of the total wages of the state. The products of the manufactures of the state, exclusive of the cities, amounted to \$89,848,125. The rapid increase in the industries of the rural districts and in the smaller towns has resulted in decreasing the percentage of the manufactures in the 7 principal cities. In 1890 the wages in these cities formed 81.1 per cent and the products 84.1 per cent of the total. These percentages were reduced in 1900 to 76.4 for wages and 79.2 for value of products. During the last decade 4 of these cities showed an actual decrease in one or more items. In Bloomington, a decrease is shown for capital, wage-earners, wages, and products; in Peoria, the decrease

was confined to value of products; in Quincy, it occurred in wage-earners, wages, and products; and in Springfield it was in the number of establishments and cost of materials.

The total for all items for the state as a whole showed a satisfactory increase during the last decade. There has, however, been a decrease in the industries that are dependent on the rural districts for their materials. "Flouring and grist mill products" is the one in which the decrease is most noticeable. The decrease in this industry extends back at least as far as 1880, for during the decade from 1880 to 1890 there was a decrease of \$9,496,673 in the value of products.

Table XLVI shows the principal decreases which have occurred in the industries of Bloomington during the last decade.

URBAN MANUFACTURES.

Hand trades	149,708	127,499	\$22,209	670,259	502,001	168,258
All other industries	656,809	656,283	974	2,446,719	2,444,888	2,836

¹ The totals for 1890 do not include the statistics for 4 establishments reported for "coffins and burial cases, trimming and finishing;" nor those for 6 establishments reported for "dentistry, mechanical."

It appears from the table that the net decrease in capital amounted to \$376,108; in the number of wage-earners to 166; in total wages to \$31,219; and in value of products to \$208,453.

A disastrous fire occurred in the city in June, 1900, just prior to the canvass of its manufactures, and the agents reported that a number of establishments had been destroyed, that some had not resumed business, and that it was difficult to locate those which had again started, their names not yet being in the city directory. Under these conditions it is possible that some establishments were omitted from the canvass and also that the fire may in a measure account for the decrease.

TABLE XLVII.—Decreases in Peoria, Ill.

INDUSTRIES.	PRODUCTS.			
	1900	1890	Increase.	Decrease.
All industries ¹	\$48,871,596	\$55,483,223	\$6,611,627
Flouring and grist mill products	496,802	621,453	124,656
Lumber, planing mill products, including sash, doors, and blinds	158,000	412,902	254,902
Hand trades	3,528,427	2,842,344	\$686,083
All other industries	44,688,367	51,606,519	6,918,152

¹ The totals for 1890 do not include the statistics for 3 establishments reported for "coffins and burial cases, trimming and finishing;" but include those for 2 establishments reported for "dentistry, mechanical."

Table XLVII shows the principal decreases which have occurred in the industries of Peoria during the last decade.

The net decrease in the value of products in the city amounted to \$6,611,627. The total decrease in the group of "all other industries," \$6,918,152, includes the decrease reported for distilled liquors. At the census of 1880 there were 14 establishments reported for this industry, with products valued at \$8,196,000. In 1890 they had been consolidated under one ownership, and were reported as one establishment, being included in the group of "all other industries." In 1900 there were 11 establishments reported, with products valued at \$26,792,354. The practice of the Census Office in reporting internal-revenue tax, when it was actually paid by the manufacturers, is to include it in the value of the products, and as the inclusion or exclusion of this amount greatly affects the gross value of the products, it is probable that the lack of uniformity in paying this tax at the several censuses has resulted in the apparent decrease in the value of the products for this industry.

Table XLVIII shows the principal decreases which have occurred in the industries of Quincy during the last decade.

STATISTICS OF MANUFACTURES.

TABLE XLVIII.—DECREASES IN QUINCY, ILL.

INDUSTRIES.	WAGE-EARNERS.				WAGES.				PRODUCTS.			
	1900	1890	Increase.	Decrease.	1900	1890	Increase.	Decrease.	1900	1890	Increase.	Decrease.
All industries.....	4,509	4,577	68	\$1,918,452	\$1,986,408	\$67,956	\$9,234,988	\$10,895,102	\$1,160,114

The large decrease in the value of products reported for flour and grist mills confirms the statement previously made that there was a general decline in the industry for the entire state. The manufacture of tobacco, especially "chewing, smoking, and snuff," appears to have almost disappeared from the city. In

1880 there were 4 establishments reported for this industry, with products valued at \$1,776,070; in 1890 there were 3 establishments, with products of \$578,500; while in 1900 there were only 2 establishments, and the value of their products had decreased fully 90 per cent.

¹ Not reported in 1880.

13. *Indiana*.—Table XLIX shows that the increase in value of products of the manufactures of the state as a whole has been somewhat in excess of that of the 6 principal cities.

In 1880 the wages and products of the 4 principal cities formed 35.1 and 34.1 per cent of the total for the state, and in 1900, 28.4 and 32.6 per cent, respectively. In 1890 the wages and products of the 6 cities formed 42.8 and 39.1 per cent of the total, and in 1900, 34.8 and 37.4 per cent, respectively. Notwithstanding this

decrease for the twenty-year period in the extent of concentration of manufactures in the larger cities, the 81 principal cities and towns of the state in 1900 contained 55.7 per cent of all the establishments, paid 83.8 per cent of the total wages, and their products formed 85.2 per cent of the total products of the state.

New Albany is the only city in the state in which the totals for all industries show a decrease. Table L shows the principal decreases which have occurred in the industries of the city during the last decade.

¹ The totals for 1890 include the statistics for 2 establishments reported for "coffins and burial cases, trimming and finishing," and those for 1 establishment reported for "dentistry, mechanical."

The increased use of natural gas as a fuel during the decade from 1890 to 1900 appears to have been in many respects disastrous to the industries of New Albany, as many of its largest establishments removed to the gas regions, where they could have the benefit of this advantageous fuel. As shown by the table, the largest decreases occurred in the manufacture of glass, for

which 3 establishments were reported in 1890, while the industry had apparently disappeared from the city in 1900. Large decreases also occurred in iron and steel and its allied industries. The statistics given in the above table, and in the detailed tables in Part II, show the condition of the industries during the census year.

¹ Not reported in 1880.

14. *Iowa*.—Iowa is preeminently an agricultural state. It ranked first in 1900 in the gross value of agricultural products and seventeenth in the value of products of manufactures.

There has not been so rapid an increase in the manufactures during the last decade as during former ones, and the proportion of manufactures in the principal cities has decreased. While from 1880 to 1890 the per cent of increase in products of manufactures in the state was 76, and in the 3 principal cities 87.7, in the decade from 1890 to 1900 the state showed an increase of 31.6, and the 3 cities but 17.1 per cent. In 1880 the value of products of the 3 cities amounted to 21.1 per cent of the value of products of the state, in 1890 to 22.5 per cent, and in 1900 to 20.1 per cent. The number of establishments in the state increased 7.5 per cent from 1880 to 1890, and 99.2 per cent from 1890 to 1900; yet the 3 cities, which in 1880 represented 10 per cent of the number of establishments in the state, represented only 9.2 per cent in 1900. The total amount of wages paid in the state increased 110.1 per cent from 1880 to 1890, and only 17.1 per cent in the following decade; yet of all wages paid in 1880, 27.7 per cent was in the 3 cities, while in 1900 this had decreased to 24.4 per cent.

These results are due largely to the fact that the manufacture of butter and cheese, which is essentially a rural manufacture, has made rapid strides during the last decade, having increased 50.3 per cent in value of products.

Only 21.1 per cent of Iowa's population live in the 39 cities and towns which were withdrawn from the enumerators. The value of products of these cities and towns in 1900 amounted to 72 per cent of the gross value of products of manufactures of the entire state. The agricultural resources of the state have been developed to meet the demands of the markets of Chicago, St. Louis, Omaha, and other points which are in immediate communication with all parts of the state by a perfect system of railroads. Manufactures have, therefore, been to some extent neglected and the growth of the cities retarded. Nevertheless, the increase in manufactures during the last decade has been in keeping with the increase in the majority of the states.

Of the 6 cities in the state for which comparative figures are available, all but the largest, Des Moines, show decreases in one or more of the items.

Table LII shows the principal decreases which have occurred in the industries of Burlington during the last decade.

¹ The totals for 1890 include the statistics for 2 establishments reported for "hay and straw baling."

The commercial and industrial growth of Burlington formerly depended largely upon the river traffic, and when the railroads diverted this traffic the growth of the city was retarded. It does not have the advantage of being a competitive point for eastern business, and cities enjoying that advantage have therefore surpassed Burlington. In the table, 4 of the industries in which there has been a decrease in the amount of wages show increases in value of products. Three of these industries also show a decrease in the average number of wage-earners employed during the year. The decrease in the two items may be due in a measure to the change in the methods of computing the average number of wage-earners, and also to a change in the charac-

ter of the materials consumed during 1900. "Lumber and timber products," in which there is shown a decrease of 107 in number of wage-earners and \$14,847 in wages, has also declined generally throughout the state; therefore the decrease in this industry in the city of Burlington is in harmony with the decrease in the state.

Davenport is located on the Mississippi River, and Council Bluffs and Sioux City are on the Missouri River. All, therefore, are to some extent under the influence of conditions which are affected by the river traffic. Tables LIII, LIV, and LV show the principal decreases which have occurred in the industries of these 3 cities during the last decade.

¹ Decrease.

²Not reported in 1880.

15. *Kansas.*—The percentages of increase in wages and value of products of manufactures in the state during the last decade have been exceeded by those of the 3 principal cities, there having been an increase of 22.8 per cent in wages and 56.2 per cent in products for the state, as compared with 29 per cent and 74.3 per cent, respectively, for the cities. The percentage of the total products which was reported from these cities has also increased. At the census of 1900, 81.1 per cent of the total wages was reported for the 36 principal cities and towns.

With the exception of Wichita, each of the 3 principal cities shows substantial increases. Table LVII shows the principal decreases which have occurred in the industries of Wichita during the last decade.

¹The totals for 1890 include the statistics for 2 establishments reported for "dentistry, mechanical."

In Wichita there was a decrease in the amount of capital invested, wages paid, and value of products. The decreases appear to have been generally distributed through the industries of the city and were evidently

the result of business depression. The group of "hand trades" shows a net increase, although there were decreases in a number of the individual industries included.

¹ Decrease.² Not reported in 1880.

16. *Kentucky.*—The increase in the value of products of manufactures of the state during the decade from 1890 to 1900 has been somewhat in excess of the increase for the principal cities, and the total wages have increased for the state while they decreased for the cities. The population of the cities, however, has increased at a greater ratio than that of the state. The small percentage of increase in the manufactures of the cities in this decade has resulted in a decrease in the percentage which the manufactures of the cities formed of the total. In 1880 the 3 principal cities had 64.2 per cent of the total wages of the state and 59.1 per cent of the total products. These percentages increased to 68 and 60.9 per cent in 1890, and decreased to 60.9 and 58.7 per cent,

respectively, in 1900. In 1890 the wages of the 4 principal cities formed 70.5 per cent, and the products 63.1 per cent of the total; in 1900 they had decreased to 63.4 per cent for wages and 60.6 per cent for products. Notwithstanding the decrease in the percentage of the manufactures in the principal cities, the industries in 1900 were still largely restricted to urban districts.

The statistics of Covington and Newport indicate that the manufactures of these cities have decreased, and these decreases have affected the totals for the state. Tables LIX and LX show the principal decreases which have occurred in the industries of these two cities during the last decade.

¹ The totals for 1890 do not include the statistics for 4 establishments reported for "coffins and burial cases, trimming and finishing."

The commercial and industrial interests of Newport and Covington are closely allied with the interests of Cincinnati, Ohio, and the statistics for that city show a decided decrease in manufactures. It is probable that quite a number of the manufacturing establishments have removed from all these cities to localities where

advantage could be taken of better economic conditions. In the case of a number of the industries, however, there is reason to believe that the decrease was also due in part to business depression. In this connection, reference should be made to the explanation concerning the decreases shown for the city of Cincinnati.

¹ Decrease.

² Not reported in 1880.

17. *Louisiana.*—Table LXI shows that the manufactures of the state are largely confined to the city of New Orleans. The percentages of increase shown for both the state and city during the decade from 1880 to 1890 were exceptionally large and were due in a measure to the more thorough canvass of the city at the latter census. The increase in the city during the decade from 1890 to 1900 was considerably less than the percentage of increase in the state for the same period, and the percentage which the manufactures of the city formed of the total for the state in 1900 was

smaller than at any prior census. The reports for the 5 cities and towns, the statistics of which were shown separately in 1900, indicate an even distribution of manufactures between the urban and rural districts, the establishments of the 5 cities having paid, in 1900, 55.6 per cent of the total wages, and put out 58.6 per cent of the total value of products of the state.

Table LXII shows the principal decreases which have occurred in the industries of New Orleans during the last decade.

¹The totals for 1890 do not include the statistics for 7 establishments reported for "coffins and burial cases, trimming and finishing;" nor those for 7 establishments reported for "dentistry, mechanical."

From the table it appears that there was a net decrease of 2,893 in the average number of wage-earners, and of \$624,353 in wages. There was, however, a net increase of \$15,279,581 in the value of products. Cotton compressing, which has been an important industry in New Orleans, was not included in the statistics of manufactures for that city at the census of 1900. In 1890 this industry gave employment to 1,029 wage-earners and paid \$586,735 in wages. The omission of the corresponding statistics for 1900 accounts, in a large measure, for the decreases.

Immediately upon the completion of the canvass in

New Orleans, the work of the special agents was carefully revised, and advantage was taken of every opportunity to check the schedules and secure returns from all establishments in existence during the census year. The city board of trade assisted in the revision of the canvass, and a recanvass was made of some industries in which decreases appeared. The work, however, confirmed the accuracy of the original canvass. The figures, therefore, may be accepted with confidence as showing the actual conditions of the industries of the city during the census year 1900.

¹ Decrease.

² Not reported in 1880.

18. *Maine.*—The statistics of manufactures were published separately for the city of Portland at the census of 1880. The percentage of increase in this city was considerably less during the decade from 1890 to 1900 than

during that from 1880 to 1890. The percentage of the value of products in the city has decreased from 12.3 per cent in 1880 to 9 per cent in 1900. The percentage of products of the two principal cities, Portland

URBAN MANUFACTURES.

cclxxxiii

and Lewiston, has also decreased from 21.4 per cent in 1890 to 15.7 per cent in 1900. Notwithstanding this apparent decrease in the percentage of the total manufactures in the principal cities, the 43 cities and towns of the state which were reported separately in 1900 show a major percentage, in all particulars, of the manufactures of the state.

In the city of Lewiston there was an actual decrease of \$485,402, or 5.4 per cent, in the value of products. Table LXIV shows the principal decreases which have occurred in the industries of this city during the last decade.

TABLE LXIV.—Decreases in Lewiston, Me.

¹ Decrease.

² Not reported in 1880.

19. *Maryland.*—The manufactures of Maryland are largely concentrated in the city of Baltimore, the principal city of the state. In the table the percentage of increase for Baltimore during the decade from 1880 to 1890 is shown to have been considerably in excess of that for the state, while during the last decade the percentage of increase in value of products was considerably less than that shown for the state. During both

decades the percentage of increase in the population of the city has exceeded that of the state. In 1890 the value of products of the establishments in the city represented 82.5 per cent of the total for the state; in 1900 it had decreased to 66.5 per cent. Table LXVI shows the principal decreases which have occurred in the industries of Baltimore during the last decade.

TABLE LXVI.—DECREASES IN BALTIMORE, MD.

INDUSTRIES	WAGES.				PRODUCTS.			
	1900	1890	Increase.	Decrease.	1900	1890	Increase.	Decrease.

¹ The totals for 1890 do not include the statistics for 67 establishments reported for "coffins and burial cases, trimming and finishing," nor those for 42 establishments reported for "dentistry, mechanical;" but include those for 1 establishment reported for "hay and straw baling."

STATISTICS OF MANUFACTURES.

The decreases shown in the table for a number of the principal industries of the city may be accounted for in some instances by the removal or discontinuance of establishments. In 1890 there were reported 9 glass factories, employing 1,171 wage-earners, and paying \$588,965 in wages, with products valued at \$1,009,047, as compared with 3 establishments in 1900, employing 266 wage-earners, and paying \$139,384 in wages, with products valued at \$220,295.

The decrease in "fruits and vegetables, canning and preserving," is due to some extent to the method of classifying reports. Establishments engaged in this industry during a portion of the year may be engaged in the canning of fish and oysters during the winter season. If for the census year 1900 they were thus engaged, and the value of products of the latter branch exceeded that of the former, they were included in classes other than "fruits and vegetables, canning and preserving."

¹ Decrease.² Not reported in 1880.

20. *Massachusetts.*—In 1840 and 1850 Massachusetts ranked second in the value of its manufactured products; in 1860, 1870, and 1880 it was third; and in 1890 and 1900, fourth. The value of its manufactures has increased at a rate that compares favorably with the increase in other states which possess greater natural advantages. There were 14 cities in the state for which the statistics were published separately at the census of 1880, and 20 at the census of 1890. The table shows that the percentages of increase in these cities for wages and products from 1880 to 1890 were some-

what in excess of the percentages of increase in the state at large; from 1890 to 1900 they were slightly smaller. The statistics for 118 principal cities and towns shown separately for 1900 indicate that over 90 per cent of the manufactures of the state were concentrated in these urban districts. The statistics for the state, contained in the report on Manufactures, Part II, show that decreases occurred in a number of cities. Table LXVIII shows the principal decreases which have occurred in the industries of Boston during the last decade.

¹ The totals for 1890 do not include the statistics for 11 establishments reported for "coffins and burial cases, trimming and finishing," nor those for 165 establishments reported for "dentistry, mechanical."

URBAN MANUFACTURES.

cclxxxv

The decreases were confined to the average number of wage-earners, wages, and value of products. The largest decreases, except in the matter of wages, appear in "clothing, men's, factory product." The conditions under which this industry is carried on render it impracticable to obtain statistics concerning wage-earners, wages, and products that are exactly comparable with those of prior censuses. The schedule adopted at the census of 1900 required a separate return of the amount paid for contract work. In 1890, however, no provision was made in the schedule for this separation. It is possible, therefore, that the wage-earners working for contractors were in some instances included in the reports of the original manufacturer and also in the reports of the subcontractors, thus duplicating the number of wage-earners and their wages in 1890. This may result in vitiating to some extent comparison with the present census. In any event the form of the inquiry should be taken

into consideration in accepting the totals for the two censuses as indicating the exact condition of the industry.

Only 1 establishment was reported for the manufacture of cordage and twine in 1900, as compared with 8 at the census of 1890. The statistics for this industry in the table are grouped with "sewing machines and attachments," in order to avoid disclosing the operations of the single establishment.

The number of furniture factories in the city has also declined from 96 in 1890 to 50 at the census of 1900, the decrease reported being the third in extent exclusive of those in the hand trades. The canvass was thoroughly checked and the reports appear to be a true representation of the actual conditions existing at the time of taking the census.

Tables LXIX, LXX, and LXXI show the principal decreases which have occurred in the industries of Haverhill, Lynn, and Malden during the last decade.

¹ The totals for 1890 do not include the statistics for 3 establishments reported for "dentistry, mechanical."

The decreases in Haverhill and Lynn are due largely to the decline in the manufacture of boots and shoes and its allied industry, the tanning, currying, and finishing of leather. The former industry was made the

subject of a special investigation at the census of 1900. The reports have been carefully revised, and it is believed that the results are a true presentation of the present condition of the industry.

¹ Not reported in 1880.

21. *Michigan*.—The manufacturing of the state depends largely upon the natural resources of lumber and minerals. The table shows a greater percentage of increase in the state during the decade ending with 1890 than during the last decade in all particulars except number of establishments. Wages increased 20.9 per cent and value of products 28.4 per cent during the last decade, as compared with 117.2 and 84.4 per cent during the decade ending in 1890.

From the table it appears that during the decade from 1890 to 1900 the number of establishments, the amount of wages paid, and the value of products of the principal cities of the state have not increased as rapidly as in the state at large. From 1880 to 1890, however, the percentage of increase for the 3 principal

cities was far in excess of the increase for the state; and during the decade ending with 1900 the percentage which the value of their products formed of the total increased from 28.6 to 37.2 per cent, in spite of a decrease in the last decade.

At the census of 1900 the urban districts comprised 63 cities, towns, and villages. The value of their products represented 68.2 per cent of the products of the state, but their population was only 36.5 per cent of the total population.

A decrease is shown for the manufacturing industries in 4 of the leading cities, namely, Bay City, Jackson, Muskegon, and Saginaw. Tables LXXIII to LXXVI show the principal decreases which have occurred in the industries of each of these cities during the last decade.

The decrease in the manufacture of lumber and timber products during the decade from 1890 to 1900 materially affected the totals for Bay City, Muskegon, and Saginaw, and evidently accounts for the decreases shown in all industries for those three cities. The decreases

in capital, wage-earners, wages, and value of products in each may be traced almost wholly to this industry and those dependent upon it, namely, boxes, wooden packing, saws, etc.

MINNESOTA.

¹ Decrease.

² Not reported in 1880.

22. *Minnesota*.—The table shows a material increase in Minnesota during the decade from 1880 to 1890, both in manufactures and population. During this time the manufacturing industries advanced at a more rapid rate than the population, this being especially noticeable in the increase of 228.5 per cent in wage-earners, as compared with the increase of 66.7 per cent in population. For the decade from 1890 to 1900, the increase in population was about the same as the increase in most of the items for industries, the total value of products showing an increase of 36.8 per cent, and the population an increase of 33.8 per cent. The increase in proportion of wage-earners to total population, however, did not keep pace with the increase in population from 1890 to 1900; in 1890 the wage-earners comprised 5.4 per cent of the population; in 1900 only 4.4 per cent.

The statistics for St. Paul and Minneapolis were published separately at the census of 1880. The percentage of increase for these cities from 1880 to 1890 was considerably in excess of the increase in the state. During the decade from 1890 to 1900, however, the percentages of increase for wages paid and value of products in the state were greater than in the 3 principal cities, St. Paul, Minneapolis, and Duluth. The percentage which the manufactures of these 3 principal cities formed of the state's manufactures apparently decreased from 1890 to 1900. In 1890 the number of establishments in the 2 principal cities formed 55.5 per cent of the number in the state; in 1900, 35.6 per cent. In 1890 the total wages paid in these cities formed 66.1 per cent of the total wages paid in the state; in 1900, 57.4 per cent. In 1890 the products of the 2 cities formed 60.4 per cent, and in 1900, 56.9 per cent of the

total products. The products of the 3 principal cities in 1890 formed 65 per cent, and in 1900, 61 per cent of the total products. Notwithstanding this decrease in the percentage of the total products in the principal cities, the 27 principal cities and towns of the state in 1900 produced 78.1 per cent of the total value of products.

As shown by the table, there has been a decrease in the aggregate number of establishments reported for the principal cities. This is due partly to the large decrease in the city of Minneapolis, where flouring and grist mills constituted the city's most important industry for 1900. The number of establishments in this industry has decreased from 25 to 12 in the last decade, and yet the total wages paid and the quantity and value of the products have largely increased. A decrease in establishments occurs also in the hand trades, there being 351 fewer establishments reported for carpentering, masonry, painting, paper hanging, and plastering at the census of 1900 than in 1890. The population of the 2 principal cities increased 237.1 per cent during the decade from 1880 to 1890, and this greatly stimulated the building trades. On the other hand, while the population increased at the rate of 22.8 per cent from 1890 to 1900, the increase was accompanied by an actual decrease in building operations.

In St. Paul there has been an increase in the number of establishments and the value of products, accompanied by a decrease, confined largely to the building trades, of \$724,745 in wages. The 5 hand trades mentioned for Minneapolis show in St. Paul a decrease of 90 establishments and of \$1,837,008 in wages.

MISSISSIPPI.

TABLE LXXVIII.—Percentages of increase and percentages of manufactures and population in cities: 1880 to 1900.

	PER CENT OF INCREASE.		PER CENT OF TOTAL FOR THE STATE.	
	The state.		11 cities, towns, etc.	State, exclusive of 11 cities.

¹ Not reported in 1880.

23. *Mississippi*.—The table indicates that from 1880 to 1890 the percentages of increase in all the particulars for manufactures, excepting number of establishments, were largely in excess of those for the decade ending in 1900, while for population the greater increase was during the last decade. There appears to be a wide distribution of manufactures in the rural districts. The 11 principal cities for which the statistics of 1900 are published separately contained only 11.2 per cent of the establishments, paid 29.2 per cent of the wages, and produced 28.3 per cent of the value of products of the state. The population of these cities formed only 4.8 per cent of the total population.

¹ Decrease.² Not reported in 1880.

24. *Missouri*.—The total wages and the value of the products for the 3 principal cities for which separate totals were shown in 1880 increased from 1880 to 1890 at the rate of 155.3 and 116.9 per cent, respectively, as compared with 145.3 per cent and 96.2 per cent in the state for the same decade. The percentage of increase during the last decade has been considerably less than during the decade ending with 1890. The value of products for the 3 principal cities referred to above increased only 10.6 per cent, as compared with 18.8 per cent in the total for the state.

In 1880 the value of the products reported for the 3 principal cities formed 76.1 per cent of the products of the state; in 1890, 84.1 per cent; and in 1900, 78.3 per

cent. The 25 principal cities for which separate statistics are shown in 1900 contained 58.7 per cent of the establishments, paid 89.4 per cent of the wages, and manufactured 85.5 per cent of the value of the products of the state. While the percentage of manufactures in the cities has been apparently decreasing, the percentage of the population in these cities has steadily increased. In the 3 principal cities it has grown from 20.2 per cent in 1880 to 27.1 per cent in 1900; and the 25 cities separately shown for 1900 contain 33.2 per cent of the population.

Table LXXX shows the principal decreases which have occurred in the industries of St. Louis during the last decade.

All other industries

¹ The totals for 1890 do not include the statistics for 27 establishments reported for "coffins and burial cases, trimming and finishing;" nor those for 52 establishments reported for "dentistry, mechanical," nor those for 4 establishments reported for "electric light and power."

The total for the state, exclusive of St. Louis county and St. Louis city, shows an increase of 58.1 per cent in the value of products during the last decade. The

*

decreases in the city of St. Louis, therefore, are responsible for the relatively low percentage of increase in the state as a whole. Numerous industries of the

city show large decreases in wages, and products, although the total for all industries shows an increase, except in the item of wages, which shows a net decrease of \$3,421,286.

The canvass was carefully checked and revised, and the figures for 1900 apparently afford a true picture of

the actual condition of the industries of the city during that year. The decreases, therefore, can only be accounted for by the fact that there has been an actual decrease, or that the canvass of 1890 was not conducted on lines uniform with that of the canvass of 1900.

MONTANA.

Population.....	237.5	75.2	28.3	71.7

¹Not reported in 1880.

25. *Montana.*—The growth of manufactures is best represented by the percentages of increase in the several particulars: 273.7 per cent in the number of establishments, 382.3 per cent in wages paid, and 936.3 per cent in value of products. This rapid increase is due very largely to the fact that the totals for 1900 include the smelting and refining of metals. At the censuses of 1880 and 1890, the statistics for these industries were included in the reports on mines and mining. In 1900, of the total value of products for manufactures, \$41,651,316, or 73 per cent, is reported for copper and lead smelting and refining.

¹Decrease.

²Not reported in 1880.

26. *Nebraska.*—The percentages of increase in the manufactures of the state were exceptionally large during the decade ending with 1890, owing principally to the fact that large increases were shown for the manufactures of Omaha, the only city for which statistics were published separately at the census of 1880. The percentage of increase in the state during the decade from 1890 to 1900 has been somewhat in excess of the percentage in the cities of Omaha and Lincoln. A fair percentage of the manufactures of the state has been located in these cities, and this has decreased during the past decade. In 1890 the wages paid and the value

of products formed 56.1 and 49.5 per cent, respectively, of the totals for the state; in 1900, 39.7 and 32.8 per cent. The tendency appears to be to a wider distribution of manufactures and the development of the smaller cities. The 10 principal cities which were shown separately in 1900 contained 34.4 per cent of the establishments, paid 79.8 per cent of the wages, and manufactured 87.8 per cent of the value of products.

Tables LXXXIII and LXXXIV show the principal decreases which have occurred in the industries of Lincoln and Omaha during the last decade.

¹Decrease.²Not reported in 1880.

27. *Nevada.*—Nevada's rank in agriculture is forty-seventh, but even this place is higher than the one held by the state in manufacturing, which is forty-ninth. The agricultural products of the state in 1900 were valued at \$6,758,337, as against \$1,643,675 for the gross value of manufactured products.

The manufacturing statistics of the state show a large percentage of decrease for the decade ending in 1890, followed by a substantial increase during the decade ending with 1900. The population continued to decrease during the latter decade.

¹ Less than one-tenth of 1 per cent.

² Not reported in 1880.

28. *New Hampshire.*—Table LXXXVI shows a smaller percentage of increase for the state in the amount of capital for the decade ending in 1900 than for that ending in 1890, but the absolute increase remained about the same. The percentage of increase in the value of products has been considerably in excess of the increase in population. In 1880 Manchester contained only 3.8 per cent of the total establishments; these paid 22.8 per cent of the wages, and their products formed 19.1 per cent of the total products; these percentages increased to 12, 27.1, and 23.5 per cent, respectively, in

1890. The percentage of the establishments continued to increase, and reached 12.4 per cent in 1900, while the percentages of wages and products slightly decreased—the percentage of wages to 25.5 per cent, and that of products to 22.4 per cent.

The table indicates that the manufactures were largely confined to the cities and towns, which contained 65.8 per cent of the establishments, paid 81.4 per cent of the wages, and manufactured 79.2 per cent of the value of products.

NEW JERSEY.

¹ Not reported in 1880.

29. *New Jersey.*—The table shows that, except in the items of capital and wages, there was a larger percentage of increase in the manufactures of the state during the decade ending with 1900 than during that ending with 1890; also that for the past twenty years the percentages of increase for wages and products of the state have been considerably in excess of those for its principal cities. On the other hand, the percentage of increase in the population of the cities has been in excess of that

of the state. The percentage of the population in the 7 principal cities increased from 42.9 per cent in 1890 to 43.4 per cent in 1900; the percentage in number of manufacturing establishments in these cities, however, decreased from 63.3 to 48.5 per cent, and the wages and value of their products from 67.1 and 67 to 59.6 and 55.8 per cent, respectively.

Five of the principal cities are located in the northern portion of the state, and their industrial growth has

STATISTICS OF MANUFACTURES.

been stimulated by proximity to the markets of New York city. In 1890 the number of establishments in these 5 cities was 4,294, and in 1900, 6,117, an increase of 42.5 per cent, as compared with the increase of 67.8 per cent in the whole state. The value of their products in 1890 was \$190,757,260, in 1900, \$289,106,480, an increase of 51.6 per cent, as compared with an increase of 72.5 per cent for the state. In 1890 the number of establishments in these cities formed 46.5 per cent of the total, and in 1900, 39.5 per cent, as compared with

53.8 per cent and 47.8 per cent, respectively, for the values of their products. The manufactures of the state were largely limited in 1900 to the 44 principal cities and towns for which statistics were published separately. These places contained 71.8 per cent of the establishments, 79.5 per cent of the value of products, and 63.5 per cent of the population.

Tables LXXXVIII and LXXXIX show the principal decreases which have occurred in the industries of Camden and Trenton during the last decade.

¹ Decrease.

² Not reported in 1880.

30. *New Mexico.*—The manufactures of the territory have increased rapidly during the last decade. The number of establishments increased 230.7 per cent; the wages, 187.1 per cent; and the total value of products, 269.7 per cent. The statistics for the census of 1900, however, include reports from 2 smelting and refining establishments, 1 copper and 1 lead, which were not included in the totals for 1890. The percentages, therefore, are not a true indication of the actual increase in the manufactures.

¹ Not reported in 1880.

31. *New York.*—Since 1850 New York has held first rank among the states in the value of its manufactured products. The table shows a large increase in these industries during the past twenty years. The increase in the state as a whole has been accompanied by a corresponding increase in the product of establishments located in the principal cities. During the decade ending with 1890 the total wages paid in the 12 principal cities of the state increased 94.7 per cent, and the value of products 66.3 per cent, as compared with 86.5 per cent and 58.4 per cent, respectively, in the state. The relative increase in the manufactures of the principal cities during the decade ending with 1900 has been somewhat less than that of the total for the state, with the exception of the item "miscellaneous expenses." Of the 12 cities for which percentages of increase are shown in the above table, 3 are located on the Hudson River and 3 on the Erie Canal. The cities located on these water routes have shown great industrial activity during the last half of the century. Their industrial development was given a strong impetus early in the last century by these lines of traffic. In 1880 the products of the manufactures of the 12 principal cities formed 74.8 per cent of the total for the state. This

percentage increased to 78.6 in 1890, and decreased to 75.7 per cent in 1900.

The products of the 16 principal cities of the state which were shown separately in 1890 formed 84.1 per cent of the total in that year, and in 1900, 80.8 per cent. The decrease in the relative percentage of the products has been accompanied by a corresponding decrease in each of the particulars shown in the above table, with the exception of miscellaneous expenses and population. On the other hand, the percentage of the population in the cities appears to have been steadily increasing. The products of the establishments in the 106 principal cities and towns in 1900 formed 90.8 per cent of the total products, and their population 71.8 per cent of the total.

The percentages of increase for the 16 cities during the last decade indicate a general advance in their manufacturing interests. In 9 of these cities, however, there has been a decrease in one or more of the items capital, wage-earners, wages, and value of products. Tables XCII to C show the principal decreases which have occurred in the industries of these 9 cities during the last decade.

Value of products	100.9	135.1	38.8	61.2
Population	15.6	17.1	7.3	92.7

¹ Decrease.² Not reported in 1880.

32. *North Carolina*.—It appears that the state has turned somewhat from agricultural to manufacturing pursuits during the decade, and that the leading in-

dustries of the state are now manufacturing rather than agricultural. The table shows that the number of establishments increased during the last decade 97.1 per cent; the amount of wages paid, 111.7 per cent; and the value of products, 135.1 per cent; as compared with a decrease of 3.6 per cent and increases of 139.1 per cent and 100.9 per cent, respectively, during the decade ending with 1890. The principal industries of the state in 1900 were the manufacture of "cotton goods," "lumber and timber products," and "tobacco, chewing, smoking, and snuff." The lumber and timber products are rural in character. From the table it appears that the manufacturing industries generally were in the rural districts in 1900. The 15 cities for which separate totals are given contained only 15 per cent of the establishments, paid 36.6 per cent of the total wages, and manufactured 38.8 per cent of the value of products; but they had only 7.3 per cent of the population, which is much less than the percentages shown for the items of manufacture.

NORTH DAKOTA.

¹ Admitted as a state, 1889.

33. *North Dakota*.—In 1890, when North Dakota was first separately reported, the state ranked twenty-sixth in value of products of agriculture and forty-fourth in manufactures. The products of agriculture for the census year were valued at \$64,252,494, and the stock on farms and ranges at \$41,951,659, a total of \$106,204,153, while the products of manufactures were valued at only \$9,183,114.

Manufacturing is limited almost entirely to the local industries and hand trades, but the table shows that during the decade there has been a large percentage of increase.

¹ Decrease.

² Not reported in 1880.

34. *Ohio*.—During the decade ending with 1890 the percentage of increase in the manufactures of the state was considerably greater than the percentage for the decade ending with 1900. During the former decade the number of establishments increased 38.5 per cent; wages, 106.8 per cent; and the value of products, 84.2 per cent; as compared with 13 per cent in number of establishments, 19.9 per cent in wages, and 29.7 per cent in the value of products for the decade ending with 1900. The same is true of the percentages of increase shown for the 6 principal cities reported separately in 1880, the total wages increasing 114.4 per cent and the value of the products 98.9 per cent during the decade ending with 1890, while during the decade ending with 1900 the total wages paid increased but 4 per cent, and the value of products only 9.3 per cent.

The smaller increase in the manufactures of the principal cities indicates that the manufacturing enterprises of the state have developed more rapidly in the smaller cities and in the rural districts.

The percentage of the establishments in the 10 principal cities of the state decreased from 49.5 in 1890 to 39.8 in 1900, the percentage of wages from 68.6 to 61.3, and the value of products from 67.4 to 60.2. These decreases in the percentages of the manufactures in the cities point to the inference that the establishments have been leaving the principal cities and locating in the smaller towns and rural districts.

Despite this possible tendency to diffusion, manufactures in the state are still predominantly urban. The 101 cities and towns for which the statistics of manufactures are shown separately in 1900 contained 64.8 per cent of the establishments, paid 88.6 per cent of the total wages, and produced 86.5 per cent in value of the products shown for the state.

The statistics of manufactures for Canton, Cincinnati, and Springfield show an actual decrease. Tables civ to cvi show the principal decreases which have occurred in the industries of these cities during the last decade.

¹The totals for 1890 do not include the statistics for 6 establishments reported for "coffins and burial cases, trimming and finishing."

The largest decreases are shown for the city of Cincinnati. The prosperity or depression of the manufacturing industries of each city depends largely upon the peculiar local conditions, but it is probable that the general tendency toward a wider distribution of manufactures may account, in a measure at least, for the decreases in the 3 principal cities. The decreases in Cincinnati were distributed through a large number of industries and appeared not only in the manufactures proper, but in the hand trades. Immediately upon the completion of the canvass, attention was called to the

fact that the results indicated a decrease. The field work, therefore, was carefully revised, and a recanvass was made of all industries the statistics of which had seemed unsatisfactory. The totals for 1900 may therefore be accepted as showing the actual condition of the industries of the city during that year. The decreases may be due, in a measure, to the fact that the methods followed in securing reports at the two censuses were not identical, especially in regard to the hand trades, such as boots and shoes, custom work and repairing, etc.

Population		544.2	5.0	95.0

¹ Not reported separately in 1880.

35. *Oklahoma.*—The principal industries of the territory are agriculture and stock raising. The agricultural products in 1900 were valued at \$45,447,744, and the stock on farms and ranges at \$53,921,827, a total of \$99,369,571, as against \$7,083,938, the value of the products of manufactures.

The products of the principal industry, flour and grist milling, amounted to \$3,745,434, or 52.9 per cent of the total of manufactured products. This industry, depending entirely upon agriculture for its raw material, is widely distributed over the rural districts, and therefore the percentage of the total products in the two cities of the territory was comparatively small.

¹ Decrease.

² Not reported in 1880.

36. *Oregon.*—Measured by the value of products, manufacturing is the largest industry of the state, the products being valued at \$46,000,587 in 1900, as compared with \$38,090,969 for the products of agriculture. There has been a notable increase in manufactures during the past twenty years, the larger increase occurring in the decade ending with 1890.

A large percentage of the manufactures was in the city of Portland, for which the percentages indicate a decrease during the last decade, with the exception of the items "number of establishments" and "cost of materials used." This decrease has affected the state as a whole and reduced the percentages of increase as

compared with the decade ending with 1890. The percentages which the wages and products of the city of Portland formed of the total for the state decreased from 65.1 and 61.4 in 1890 to 52.2 and 51 per cent, respectively, in 1900.

The urban manufactures, represented by the totals for the 6 principal cities, formed 67.6 per cent of the total wages and 66 per cent of the total value of products in 1900.

Table CIX shows the principal decreases which have occurred in the industries of Portland during the last decade.

STATISTICS OF MANUFACTURES.

¹ The totals for 1890 do not include the statistics for 5 establishments reported for "coffins and burial cases, trimming and finishing."

The decreases occur largely in the building trades, and are explained, in part at least, by the fact that in 1890 the city was in the midst of a great building boom which has since subsided. The decreases in the value of products for carpentering and for masonry were each

greater than the net decrease of the entire city. The manufacturing industries have not been generally affected, therefore, so extensively as the totals for the city indicate.

¹ Not reported in 1880.

37. *Pennsylvania.*—The percentages of increase for the state and its principal cities during the ten years ending with 1890 were considerably in excess of those shown for the last decade, except in the number of establishments.

The percentages of increase in number of establishments, capital, and value of products for the cities in the former decade were considerably in excess of those for the state, but during the ten years ending with 1900 the development of the cities has apparently been at a

smaller ratio than that of the state as a whole. The number of establishments in the 16 principal cities of the state increased at the rate of 3 per cent, as compared with 32.7 per cent in the total for the state. The amount of wages paid in the cities increased 12.1 per cent and in the state 26.1 per cent, while the value of the products of the cities increased 23.9 per cent, and in the state 37.8 per cent.

The smaller increase in the cities has been followed by a decrease in the percentage which their manufac-

tures are of the total. This decrease in the percentage since 1880 in the 9 principal cities appears for each item shown in the above table, with the exception of number of establishments and population, and the same is true of the percentages shown for the 16 principal cities separately reported in 1890. In 1880 the 9 principal cities contained 36.5 per cent of the total number of establishments. This percentage increased to 57.1 in 1890, and decreased to 43.2 per cent in 1900. The percentage of total wages in the cities, which in 1880 formed 66.1 per cent of the total wages, decreased steadily until 1900, when it amounted to 55.6. The percentage of the total value of products of the manufactures of the 9 cities, which in 1880 formed 59.4 per cent of the total products of the state, increased to 61.5 in 1890, and then decreased to 53.8 in 1900. The percentage of the total number of establishments in the 16 principal cities of the state decreased from 61.3 in 1890 to 47.6 in 1900. This decrease has been accompanied by a decrease in the wages from 70.6 per cent to 62.7 per cent, and in the value of products from 67.8 per cent to 60.9 per cent. Notwithstanding the comparatively slower development of the cities and the decrease in the percentage which they form of the total for the state, it appears that the 133 principal cities and towns for which the statistics of 1900 are published separately contained 64.1 per cent of

the establishments, and their wages amounted to 80.1 per cent of the total wages, while the value of their products formed 78.4 per cent of the total products. The manufactures of the state, therefore, were largely restricted to the urban districts, these districts containing, however, only one-half of the population.

The statistics for Philadelphia indicate that there has been a net decrease in the amount of wages paid in the manufactures of that city during the last decade. The apparent decrease in several industries in that city may be due in part to the removal of establishments to the rural districts, where the expense of operating is less. As confirming this possibility, it appears that while Philadelphia shows a decided decrease in the manufacture of boots and shoes and silk and silk goods, the state shows a steady growth in both industries.

The statistics for Williamsport show a decided decrease in the items, capital, wage-earners, wages, and products for "furniture, factory product" and "lumber and timber products." These conditions are probably due to the practical exhaustion of the standing timber in that locality, which compels the removal of such establishments to points nearer the base of their supplies.

Tables CXI and CXII show the principal decreases which have occurred in the industries of Philadelphia and Williamsport during the last decade.

¹ Decrease.² Not reported in 1880.

38. *Rhode Island*.—Rhode Island is preeminently a manufacturing state, its agricultural products being insignificant, in comparison.

There has been a constant increase in manufactures, both in the state as a whole and in its principal cities. The percentage of increase in the cities during the last decade has been somewhat less than the percentage of increase in the state. The percentage of the population in the principal city, Providence, increased from 37.9 per cent in 1880 to 41 per cent in 1900, while the percentage of the number of establishments decreased from 54.6 in 1880 to 46.1 in 1900. The percentage of wages increased from 44.3 per cent in 1880 to 53.3 in 1890, and during the following decade decreased to 48.6 per cent. The products of the city formed 40.9 per cent of the total in 1880, this percentage increasing to 61.4 in 1890, and decreasing to 42.4 in 1900.

In 1890 the establishments in the 3 principal cities formed 74.2 per cent of the total for the state, and in 1900, 64.7 per cent. The decrease in the percentage of the establishments has been accompanied by a decrease in wages from 70.3 per cent in 1890 to 68.9 per cent in 1900, and from 72.6 per cent in 1890 to 69.5 per cent in 1900 in the value of products, while the percentage of the population has increased from 52.3 per cent in 1890 to 56.7 per cent in 1900. The percentages in the table, therefore, indicate that the tendency has been to a wider distribution of manufactures, decreasing the percentage in the principal cities. The 24 cities and towns for which statistics in 1900 were published separately contained practically all the manufacturing plants, 96.4 per cent of the number of establishments being located

in these cities; and these paid 95.1 per cent of the total wages and turned out 95.4 per cent of the products of the state.

In 1890 the town of Lincoln contained a population of more than 20,000 and its manufacturing statistics were shown separately. In 1895 the city of Central Falls was formed from a part of the town of Lincoln. At the census of 1900 the statistics of manufactures for both Central Falls and Lincoln were collected by special agents and their statistics are shown separately in the report on the manufactures of Rhode Island, contained in the Report on Manufactures, Part II; but as neither city had a population of 20,000, the statistics are not shown for industries and no comparisons can be made with the totals for the separate industries given in the census of 1890.

Table CXIV gives the totals for Central Falls and Lincoln in 1900 compared with the totals for the town of Lincoln in 1890.

TABLE CXIV.—Comparative table for Lincoln, R. I.: 1890 and 1900.

¹ Decrease.

² Not reported in 1880.

39. *South Carolina.*—There has been a marked development of the manufacturing industries during the past twenty years. The state ranked thirty-sixth in value of manufactured products in 1890 and thirty-second in 1900.

The statistics for the principal city, Charleston, which were published separately at the census of 1880, show that during the following decade the increase in the manufactures of the city was greatly in excess of the increase in the total for the state. The percentage of increase during the period between 1890 and 1900, on the other hand, was considerably less than the increase in the state, the wages and products for the state increasing 72.7 and 84 per cent, respectively, as compared with a decrease of 16.3 per cent in wages and an increase of 6.2 per cent in products for the city. The percentage of increase in the population of the city was only 1.6 per cent, and of the state 16.4 per cent.

In 1880 the wages and the value of products of the city formed 22.5 and 16.3 per cent, respectively, of the total for the state, these percentages increasing to 32.5 and 28.2 in 1890 and decreasing to 15.8 and 16.3, respectively, in 1900. The percentage which the population of the city forms of the total population of the state has decreased during the twenty years from 5 to 4.2.

The principal manufactures of the state depend largely upon agriculture for their raw material, and are therefore well distributed throughout the rural districts. The 12 principal cities and towns in 1900 contained 22.2 per cent of the establishments, paying 39.8 per cent of the total wages, and turning out 39.2 per cent of the total products of the state, while their population was 10.2 per cent.

The statistics for Charleston show a net decrease of \$288,193 in wages, and table CXVI shows the principal decreases which have occurred in the industries of the city during the last decade.

Population	16.8	3.7	96.3	

¹ Admitted as state in 1889.

40. *South Dakota*.—As South Dakota was a part of the territory of Dakota up to November 2, 1889, the census of 1890 was the first at which the statistics for the state were published separately.

The principal industry of South Dakota is agriculture. The manufacturing interests are principally confined to such industries as are of a local character, and to those in which products of agriculture form the principal materials. The table shows that there has been a large growth in manufactures during the decade, the number of establishments increasing 228.5 per cent; the wages paid, 85.5 per cent; and the value of products, 115.2 per cent. While during the last decade the value of the manufactured products increased 115.2 per cent, the value of the agricultural products increased 199.7 per cent, and the population 16.8 per cent.

¹ Not reported in 1880.

41. *Tennessee*.—The percentages of increase in the manufactures of the state during the decade ending with 1890 were considerably in excess of those of the decade ending with 1900, except in the number of establishments. There has been a correspondingly smaller percentage of increase in the principal cities. The table also shows that the percentage of value of products of manufactures in the principal cities has decreased. In 1880 the products of manufactures in the 2 principal cities formed 35.1 per cent of the total for the state, and in 1900, 33.7 per cent. The 4 principal cities for which the statistics were shown separately in 1890 turned out 59.5 per cent of value of products; this decreased to 51.2 per cent in 1900.

The percentages indicate that there is a decided tendency toward a wider distribution of manufactures. While the percentage of the value of manufactured products in the 4 principal cities has decreased from 59.5 in 1890 to 51.2 in 1900, still the 18 cities and towns reported separately in 1900 represent 64.2 per cent of the total. The urban districts show a majority percentage of the totals for the state in all particulars, except number of establishments, but they represent only 15.4 per cent of the population of the state.

Tables cxix and cxx show the principal decreases which have occurred in the industries of Chattanooga and Nashville during the last decade.

¹Not reported in 1880.

²Decrease.

42. *Texas*.—There has been a satisfactory increase in the manufacturing industries during the past twenty years. The percentage of increase during the decade ending with 1890 was considerably in excess of the increase for the period between 1890 and 1900, except in the number of establishments.

Galveston is the only city for which the statistics of manufactures were published separately at the census of 1880. The table shows that the percentage of increase in the city has been considerably less than in the state, except in capital; also that during the last decade there has been a decrease in the cost of materials and value of products. The percentage of increase in the

manufactures of the 5 principal cities for which the statistics were published separately in 1890 has also been considerably less than the increase for the state, resulting in a decrease in the percentage which the cities formed of the totals for the state. In 1880 the total wages and value of products for Galveston formed 14.9 per cent and 11.5 per cent, respectively, of the totals for the state. These percentages have decreased to 4.8 and 4.2, respectively, in 1900. In 1890 the manufactures in the 5 principal cities formed 47.3 per cent of the wages and 48.4 per cent of the value of products for the state; and in 1900, 38.2 per cent of the wages and 32.9 per cent of the value of products. The

STATISTICS OF MANUFACTURES.

percentage of the total population in the cities has also been steadily decreasing. In 1900 the total wages and the value of products reported for the 30 principal cities and towns constituted 65.1 per cent of the wages and 59.3 per cent of the products of the state. The principal industries of Texas depend largely upon agricultural products for their raw

materials, and are, therefore, found principally in the rural districts and smaller towns. The development of these industries has tended to a wider distribution of manufactures.

Tables CXXII to CXXIV show the principal decreases which have occurred in the industries of these 3 cities during the last decade.

¹The totals for 1890 include the statistics for 1 establishment reported for "coffins and burial cases, trimming and finishing," and those for 1 establishment reported for "dentistry, mechanical."

The decreases shown for Dallas and Fort Worth are confined almost entirely to the local industries and the

hand trades, and may in a measure be accounted for by changes in the character of the reports secured at the two censuses, as previously explained. There does not appear to have been a general depression in the manufacturing industries of either city.

The decreases in the totals for the city of Galveston are confined to the cost of materials and value of products, the net decrease in the value of products amounting to \$708,185. The canvass of the city was completed August 27, 1900. The work of checking the schedules with the list of manufacturers was in progress when the storm of September 8, 1900, visited the city, and the work therefore was discontinued. The statistics, however, may be accepted as a general indication of the condition of the manufactures during the census year.

¹ Decrease.

² Not reported in 1880.

43. *Utah.*—Table CXXV shows that there has been a large growth in manufactures during the last twenty years. The percentages of increase for Salt Lake City during the decade ending with 1890, both in manufactures and in population, were largely in excess of those for the territory, but in the ten years ending with 1900 the percentage of increase in the city was considerably less than that of the state. This has been followed by a decrease in the proportion of the manufactures in the city to those of the state. In 1880 the city contained 25.9 per cent of the establishments, paid 49.5 per cent of the wages, and made 37.2 per cent of the total products reported for the territory. While the proportion of the establishments in the city increased to 30.9 per cent in 1900, the proportion of wages decreased

to 47.3 per cent, and the value of the products to 28.9 per cent. The great decrease in the proportion of the value of products in Salt Lake City to those for the state is due to some extent to the statistics of lead smelting and refining in 1900. The establishments engaged in this industry reported a very large value of products, and as they were located outside of Salt Lake City, their inclusion in the reports for 1900 has tended to increase the relative importance of the districts outside. The 8 principal cities for which the statistics of 1900 are published separately contained 56.9 per cent of the establishments, which paid 70.6 per cent of the total wages, and turned out 46.2 per cent of the total products of the state.

VERMONT.

¹ Not reported in 1880

² Less than one-tenth of 1 per cent.

44. *Vermont.*—During the last decade the percentage of increase in number of establishments was 34.3, in wages, 45.2, and in the value of products, 50.3, while the increase in population is shown to have been only 3.4 per cent. The table also indicates that the manufactures were well distributed. The 21 principal cities and towns reported separately in 1900 contained 39.7 per cent of the establishments, paid 62.6 per cent of the total wages, and turned out 55.3 per cent of the total products for the state.

¹ Decrease.² Not reported in 1880.

45. *Virginia*.—The percentages of increase in total wages and value of products in the manufactures of the cities have been considerably less than those for the state. There has also been a large decrease in the percentage of the manufactures in the principal cities. At the census of 1880, the amount of wages paid in the manufactures of the 3 principal cities formed 52.9 per cent of the total wages, and the value of the products 51.9 per cent of the total products. These percentages decreased to 49.9 and 45.3 in 1890, and to 34.7 and 33.9 in 1900, while the percentage of the population in the same cities increased from 7.1 in 1880 to 8.3 in 1900. Notwithstanding the decrease

in the percentage of the manufactures of the 3 largest cities, the 23 cities and towns for which the statistics of 1900 are published separately controlled a large proportion of the manufactures in the state.

The totals for the city of Petersburg indicate that there was a decrease in the number of wage-earners, wages, and products, while for the city of Richmond a decrease in wage-earners and wages is noted, with an increase in the value of products. Tables CXXVIII and CXXIX show the principal decreases which have occurred in the industries of these 2 cities during the last decade.

¹ Not reported in 1890.

46. *Washington.*—Measured by the value of products, manufacturing was the principal industry of the state for both census periods, 1890 and 1900.

The percentages of increase for capital, wages, and products in the 2 principal cities, Seattle and Tacoma, for which the statistics of 1890 were published separately, have been somewhat less than in the state at large. The percentages in the item of wages and products which the manufactures of these cities formed of the total for the state have also slightly decreased. In 1890 the wages and products of the 2 cities formed 52.7 and 49.4 per cent, respectively, of the totals for the state; in 1900 these percentages had fallen to 41.5 for wages and 44.2 for products. The manufactures of the

state appear to be quite evenly divided between the urban and rural districts. The wages and products of the 9 principal cities for which statistics are published separately in 1900 formed 53.8 and 59 per cent, respectively, of the total for the state. The population of the cities was only 36.8 per cent of the population of the state.

The totals for the manufactures of Tacoma indicate that there has been a net decrease in wages during the last decade, and also a decrease in the value of products in certain industries, although there was a net increase in their total products. Table cxxxix shows the principal decreases which have occurred in the industries of the city during the last decade.

TABLE CXXXI.—DECREASES IN TACOMA, WASH.

INDUSTRIES.	WAGES.				PRODUCTS.			
	1900	1890	Increase.	Decrease.	1900	1890	Increase.	Decrease.
All industries	\$2,856,028	\$2,723,235	\$367,207	\$12,029,497	\$10,432,955	\$1,596,542
Lumber and timber products	577,700	838,398	260,698	2,368,065	2,794,048	\$430,983

Marble and stone work	20,056	250,988	230,932	73,300	747,800	674,500
Masonry, brick and stone ¹	413,075	499,875	86,801	1,298,839	1,621,113	322,274
Hand trades, not separately shown	1,233,444	968,517	\$314,927	8,051,870	4,899,879

¹ None in 1890.

The net decrease in wages (\$367,207) was due principally to the decreases in the manufacture of lumber and timber products and in the building trades, such as "masonry, brick, and stone." The value of products shows a net increase of \$1,596,542. There appear, however, to have been decided decreases for the value

of the products reported for some of the principal industries, including the building trades. The statistics indicate that the building operations were more extensive at the census of 1890 than during the year, 1900, and do not necessarily prove that there has been a general depression in the manufactures of the city.

¹ Less than one-tenth of 1 per cent.² Decrease.³ Not reported in 1880.

47. *West Virginia.*—The table shows that there has been a large increase in the manufactures of the state, the percentage of increase during the last decade being considerably in excess of the percentage for the decade ending with 1890, with the exception of capital. For the decade ending with 1900, the number of establishments increased 85.9 per cent, as compared with an increase of less than one-tenth of 1 per cent for 1890. The total wages increased 87.6 per cent from 1890 to 1900, as compared with 60.2 per cent from 1880 to 1890. The value of products for the decade ending with 1900 increased 93.4 per cent, as compared with 69.2 per cent for the decade ending with 1890.

The statistics for the city of Wheeling were published separately at the censuses of 1880 and 1890. The number of establishments in the city shows a decrease of 2.9 per cent during the decade ending in 1900. This decrease is due principally to the more thorough canvass of the hand trades at the census of 1890. The number of shops reported for "boots and shoes, custom work and repairing," and for "clothing, women's, dress-making," decreased from 95 in 1890 to 45 in 1900.

The total wages reported, on the other hand, increased 25.3 per cent, and the total value of products 28.6 per cent. The relative importance of the city as a manufacturing center has decreased during the past twenty years. In 1880 the number of establishments formed 10 per cent of the total number, increasing to 17.6 per cent in 1890, and decreasing to 9.2 per cent in 1900. In 1880 the wages reported formed 50.8 per cent of the total wages, this percentage decreasing to 35.8 per cent in 1890, and to 23.9 per cent in 1900. The value of products formed 40.5 per cent of the total products for the state in 1880, 33.6 per cent in 1890, and 22.4 per cent in 1900. The decrease in the percentage of manufactures has been accompanied by a decrease in the percentage of population. In 1880 the population of the city formed 5 per cent of the total population, as compared with 4.1 per cent in 1900.

The 6 principal cities and towns in 1900 contained 20.6 per cent of the number of establishments in the state, paid 52.2 per cent of the total wages, and turned out 52.3 per cent of the total products. The population of these cities in 1900 constituted only 8.9 per cent of the population of the state.

WISCONSIN.

TABLE CXXXIII.—PERCENTAGES OF INCREASE AND PERCENTAGES OF MANUFACTURES AND POPULATION IN CITIES: 1880 TO 1900.

	PER CENT OF INCREASE.					PER CENT OF TOTAL FOR THE STATE.

¹ Not reported in 1880.

48. *Wisconsin*.—The table shows that the percentage of increase in the state during the last decade is considerably less than during the decade ending with 1890, except in the number of establishments, the wages and products for 1900 showing an increase of 36 and 45.2 per cent, respectively, as compared with 128.3 and 93.8 per cent for 1890.

The statistics for Milwaukee were published separately at the census of 1880. The percentages of increase in the city during the last decade have also been considerably less than for the decade ending with 1890, the percentage of increase of wages diminishing from 141 to 20.9, and that of products from 124.3 to 27. The percentage of increase in the 4 principal cities for which the statistics were published separately in 1890 is considerably less than the percentage of increase in Milwaukee, and, for establishments, wages, and value of products, in the state. The percentage which the manufactures of Milwaukee form of the totals for the state has increased slightly since 1880 in most of the items. In that year the establishments of the city were 11 per cent of the total; their wages, 36.9 per cent; and the value of their products, 33.9 per cent. These percentages in 1890 showed a large increase, which was

followed in the last decade by a slight decrease in some of the items.

The development of the smaller cities is indicated more strikingly by the percentages shown for the 4 principal cities. In 1890 the establishments in these cities formed 35.4 per cent of the total for the state; their wages, 50.9 per cent; and the value of their products, 49.8 per cent. In 1900 these percentages had decreased to 25.5, 44.7, and 42.5 per cent, respectively. The wider distribution of manufactures is due principally to the development of the smaller cities and towns of the state rather than to the development of the rural districts. The 53 cities and towns for which the statistics of 1900 are shown separately, contained 51.5 per cent of all the establishments in the state, their wages formed 80.1 per cent, and the value of their products was 72.8 per cent of the totals.

Notwithstanding the large percentage of increase shown in the 4 cities in 1900, 2 cities, La Crosse and Oshkosh, show decreases. The cause of these decreases lies very largely in the gradual exhaustion of the supply of timber. Tables CXXXIV and CXXXV show the principal decreases which have occurred in the industries of these 2 cities during the last decade.

TABLE CXXXIV.—DECREASES IN LA CROSSE, WIS.

Cost of materials used	80.4	73.9	45.3	54.7
Value of products	168.5	81.7	44.1	55.9
Population	192.0	49.2	24.6	75.4

¹Not reported in 1880.

49. *Wyoming.*—While Wyoming is essentially a stock raising and mining region, manufacturing is also carried on to some extent. The value of the stock on farms and ranges during the census year was \$39,080,158, and the value of agricultural products \$11,907,415, making together \$50,987,573, as compared with \$4,301,240 for manufactures. Yet manufactures show a substantial increase, as indicated by the table. In 1900 the 2 principal cities, Cheyenne and Laramie, reported 24.6 per cent of the population of the state, 29.9 per cent of the establishments, 49.2 per cent of the wages, and 44.1 per cent of the total value of the products of the state.
